1. EXECUTIVE SUMMARY

INTRODUCTION

The San Francisco Public Utilities Commission (SFPUC) maintains rates to equitably recover the costs from users to operate, maintain, and finance the water supply, conveyance, and treatment systems, and the wastewater collection and treatment systems. This executive summary documents the results of the cost of service study and identifies the recommended water and wastewater rates that are appropriate to meet the SFPUC funding needs and achieve pricing objectives. The focus of this report is to detail the process utilized to achieve cost recovery and substantiate that customers are paying their fair and proportionate share of the system costs.

Following a competitive proposal process, the SFPUC hired the Carollo Engineers (Carollo) to develop an updated cost of service study for the Water and Wastewater Enterprises. The objectives of the Study were to evaluate the financial impacts of the SFPUC's 10-year financial plan from fiscal years (FY) 2019 through FY 2028 and to provide water and wastewater rate structure and revenue adjustment recommendations for the next four years. The Study recommendations and resulting rate structures must comply with the City of San Francisco ("City") Charter based on the following objectives:

Provide sufficient revenues for operations, maintenance, and repair consistent with good utility practice

Provide sufficient revenues to maintain financial condition and bond ratings

Meet requirements and covenants under all bond indentures

Develop rates based on cost of service principles and requirements

Develop capacity fees that equitably recover costs from development and upsize in usage

In accomplishing this scope, Carollo developed the financial projections, fiscal and rate policy review, cost allocations, rate and capacity charge design, and indirect cost study (with Ann Carey). This report summarizes the Carollo tasks with the exception of the indirect cost study, which is summarized in a separate report.

BACKGROUND AND SYSTEM OVERVIEW

The SFPUC is an enterprise department of the City and County of San Francisco that provides water, wastewater, and municipal power services to San Francisco. The SFPUC is responsible for the maintenance, operation, and development of three utility enterprises: the Water Enterprise, the Wastewater Enterprise, and the Power Enterprise (which is a component of Hetch Hetchy Water and Power). The Water Enterprise provides potable water to retail customers within the City, to certain retail customers outside the City, and to wholesale customers in Alameda, San Mateo, and Santa Clara counties. The Wastewater Enterprise provides wastewater collection, treatment, and disposal services for the City, as well as treatment services for Brisbane, Bay Shore and North San Mateo County Sanitation Districts. The SFPUC operates a combined wastewater and stormwater system. The SFPUC's enterprises are operated and managed as separate financial entities with separate enterprise funds. Rates and charges are established within each enterprise fund to recover costs.

Retail rates are set by the SFPUC Commission pursuant to the authority and provisions set forth by the San Francisco Charter (Section 8B.125). All SFPUC budgets, rates, fees, and charges must conform to the SFPUC Ratepayer Assurance Policy, which is guided by six key principles:

- Revenue sufficiency
- Customer equity
- Environmental sustainability

- Affordability
- Predictability
- Simplicity

The SFPUC approves the wholesale water rate annually in accordance with the requirements of the Water Supply Agreement (WSA) with the SFPUC's wholesale water customers.

Water Enterprise

The wastewater collection, treatment, and disposal/reuse system consists of a combined sewer system, which collects both sanitary sewer and wet weather flows, three water pollution control plants, and effluent outfalls to the San Francisco Bay and Pacific Ocean. The combined sewer system reduces pollution in the San Francisco Bay and Pacific Ocean by treating wet weather flows and urban runoff that would otherwise discharge to the Bay and Ocean. The SFPUC treats all sanitary flows during dry weather months before discharging the treated effluent to the San Francisco Bay and the Pacific Ocean.

The SFPUC has developed and begun the implementation of the 20-year, \$7 billion Sewer System Improvement Program (SSIP) in order to continue to meet the level of service goals for the Wastewater Enterprise and address aging infrastructure requirements. The SSIP will be implemented in three phases.

Wastewater Enterprise

The wastewater collection, treatment, and disposal/reuse system consists of a combined sewer system, which collects both sanitary sewer and wet weather flows, three water pollution control plants, and effluent outfalls to the San Francisco Bay and Pacific Ocean. The combined sewer system reduces pollution in the San Francisco Bay and Pacific Ocean by treating wet weather flows and urban runoff that would otherwise discharge to the Bay and Ocean. The SFPUC treats all sanitary flows during dry weather months before discharging the treated effluent to the San Francisco Bay and the Pacific Ocean.

The SFPUC has developed and begun the implementation of the 20-year, \$7 billion SSIP in order to continue to meet the level of service goals for the Wastewater Enterprise and address aging infrastructure requirements. The SSIP will be implemented in three phases.

COST OF SERVICE APPROACH AND FINDINGS

Carollo's review and analysis confirms the SFPUC rates and capacity charge structures are sound and adhere to industry best practices. This report documents the recommended updates to the rates and charges to remain compliant with cost of service requirements based on the unique nature of the SFPUC water and wastewater systems and customer demand patterns. In addition to achieving cost recovery and ratepayer equity objectives, the rate and capacity charge analyses presented within this report were developed to continue to promote efficient use of water and the City's natural resources.

The purpose of a cost of service analysis is to provide a rational basis for distributing the costs of the SFPUC water and wastewater systems to each customer class in proportion to the demands they place on the systems. A detailed cost allocation was developed for both the Water and Wastewater Enterprises based on the unique attributes of each system in order to meet the equity requirements of Proposition 218, the City Charter, and SFPUC policy. The Charter requires that the City perform a cost of service study at least every five years so that revenues from rates adequately fund utility operations, maintenance, and ongoing capital needs, and equitably recover costs from system users. Additionally, in California, water rates must adhere to the cost of service requirements imposed by Proposition 218 of the State Constitution.

Proposition 218 requires that property-related fees and charges, including water and wastewater rates, do not exceed the proportional cost of providing the service.

The rates presented within this report adhere to cost of service principles, as well as industry standards set by the American Water Works Association (AWWA) and the Water Environment Federation (WEF). Additionally, the SFPUC rate structures are conservation-oriented and conform to state regulatory standards, such as Best Management Practices (BMP) 1.4, for the efficient use of water.

Customer Demand Analyses

As California experiences some relief from the recent drought, some agencies within the State are currently seeing a water consumption bounce-back rather than further decline. Although a bounce-back would typically indicate a consistent, slight increase in consumption, it is not likely for water consumption to reach all-time highs for SFPUC even in a growth scenario. The primary reasons for this include shifts in public awareness. The drought enhanced public awareness of the importance of conservation and many households converted to high efficiency fixtures. Because of this significant increase in water use efficiency, it is plausible that this will offset additional demand from growth.

In addition to conducting a Time-Series trending analysis, Carollo applied a simple 0.5 percent annual reduction factor uniformly to all water and wastewater demand. This factor reflects price elasticity and helps to isolate certain likely demand drivers such as demand reductions driven by drought-related regulatory restrictions on water use, low-flow fixtures, or environmental consciousness.

REVENUE REQUIREMENTS ANALYSIS

Water Enterprise

Carollo analyzed the revenue requirements of retail customers to test the fiscal health of the SFPUC's Water Enterprise, evaluate the adequacy of current rate levels, and set the basis for near- and long-term rate planning. The revenue requirement analysis covers the study period FY 2018 through FY 2028 with the primary focus for rate setting given to four years, FY 2019 through FY 2022, of the study period as the SFPUC already has an approved rate increase for FY 2018. Carollo recommends the Water Enterprise increase retail rates by an average of 7.5 percent over the four-year period from FY 2019 though FY 2022 in order to fund operational and capital needs, as well as to meet debt service obligations associated with the capital improvement plan (CIP).

Carollo recommends the annual rate increase with the resulting cash flow represented in Table 1 for the Water Enterprise. The recommended rate increases are aimed at ensuring that the SFPUC collects sufficient funds to pay operational and capital expenses, including the debt service obligations associated with the CIP.

| TABLE 1 WATER ENTE | RPRISE REVE | NUE REQUI | REMENT WIT | TH RATE INC | REASE(I) | | | | | | |

Notes

(1) Values are in million dollars and rounded. Values may not add up due to rounding.

Many agencies use bonded indebtedness to fund a portion of their capital expenses. The debt service coverage test measures the ability of a utility to meet both legal and policy-driven revenue obligations associated with debt. To ensure that the SFPUC retains financial flexibility for contingencies, it has adopted and implemented financial policies that impose higher standards than the bond indenture minimum debt service coverage requirements of 1.00x (current) and 1.25x (indenture). The new financial policy requirements increase the minimum debt service coverage by 10 basis points to 1.10x (current) and 1.35x (indenture), which requires that the SFPUC raise enough revenue to cover all operations and maintenance (O&M) expenses. Similarly, the indenture coverage ratio requirement is an additional 10 basis points. As illustrated by Table 1, at the end of the FY 2022, the current coverage ratio is projected to be 1.12x and the indenture coverage ratio 1.61x.

As of December 2017, the Water System Improvement Program (WSIP) is approximately 95 percent complete. Eight regional projects are in construction and 39 projects are in close-out or have been completed. 40 out of 43 regional WSIP projects with specific level of service goals have been achieved to date. Besides the WSIP closeout projects, the only regional project that remains in pre-construction is the Alameda Creek Recapture Project. The CIP consists of projects that enhance the SFPUC's ability to provide drinking water in an environmentally sustainable manner to its 2.7 million residential, commercial, and industrial customers in the Bay Area. The WSIP is paid for by both retail customers in San Francisco and

⁽²⁾ Prior to this study, SFPUC approved a 7% rate increase in FY 2018.

⁽³⁾ Wholesale sales reflect previously adopted wholesale rate increases.

wholesale customers and provides regional water supply reliability including supply, transmission, treatment, and regional storage.

Wastewater Enterprise

Similar to the Water Enterprise, the primary focus for rate setting was given to the four years, FY 2019 through FY 2022, since the SFPUC already has an approved rate increase of 11 percent for FY 2018. Based on the findings of this study, Carollo recommends the Wastewater Enterprise increase rate revenues by an average of 9 percent per year over the four years, FY 2019 through FY 2022, in order to fund operations and capital needs, as well as to meet debt service obligations associated with the SSIP and other capital projects. The recommended rates also support the Wastewater Enterprise's ability to continue meeting its level of service objectives and are summarized in Table 2.

| TABLE 2 WASTEWA | TER ENTERP | RISE REVEN | UE REQUIRE | MENT WITH | RATE INCR | EASE (1) | | | | | |

Notes:

The annual rate increase recommended by Carollo is aimed at ensuring that the SFPUC's Wastewater Enterprise collects sufficient funds to pay operational and capital expenses, including the debt service obligations associated with the SSIP and other capital projects. As noted earlier, SFPUC policy sets coverage targets of 1.10x (current) and 1.35x (indenture) annual debt service. In FY 2022, the current coverage ratio is forecasted to be 2.21x and the indenture coverage ratio 4.16x.

⁽¹⁾ Values are in million dollars and rounded. Values may not add up due to rounding.

⁽²⁾ Prior to this study, the SFPUC approved an 11% rate increase for FY 2018.

⁽³⁾ Wholesale sales reflect previously adopted wholesale rate increases.

The SSIP is a 20-year citywide investment to upgrade and replace vital sewer infrastructure. Annual capital expenditures will increase substantially in upcoming years due to the 20-year SSIP. The SSIP is divided into three overlapping phases. In 2012, the Phase 1 Capital Budget Plan was approved for a total budget of \$2.91 billion and is 21.1 percent complete as of the end of FY 2017. The expected completion for SSIP Phase 1 is October 2026. All three phases are expected to total nearly \$7 billion, funded through a combination of new debt issuances and cash sources including operating revenues, capacity charges, and other sources. At the beginning of FY 2018, the SFPUC's available reserves totaled approximately \$144.7 million. The SFPUC currently exceeds the Fund Balance Reserve Policy requirement and has accordingly planned to cash fund a portion of ratepayers' share of future capital projects using available reserves.

Carollo recommends that the SFPUC review and update the financial plan and revenue requirements annually to recognize changes in customer billing data, operating expenditures, changing water demands and wastewater flows and loadings, and capital improvement needs.

COST OF SERVICE ANALYSIS

Water Enterprise

The cost of service analysis serves as a rational basis for distributing the full costs of SFPUC's services to each customer class in proportion to the demands placed on the system. Carollo developed a detailed cost allocation that serves as the basis for the proposed rate adjustments. This analysis yields an appropriate method for allocating costs, which could be sustained unless substantial changes in cost drivers or customer consumption patterns occur.

Functional Cost Allocation

The functional cost allocation assigns the annual revenue requirement for FY 2019 by major function. The water utility's primary functions are related to three commodity components (base, peak, and raw water), which are the basis of water commodity rates. The SFPUC's peaking factor averaged 1.31, which means that the maximum daily flow is 31 percent higher than average daily flow. This is determined by the peak day to average day ratio from the three years FY 2014 through FY 2016. Since FY 2012, SFPUC has experienced a decreasing peaking trend with a small increase in FY 2016. Until it can be supported that this increase will continue, the average peaking factor for the preceding three years prior to it were used.

The four customer-related costs (customer service, meter charges, public and private fire services) are the basis of the fixed water service and private fire protection charges. Together, these seven elements are referred to as functional cost categories. In addition to these seven, an As All Others (AAO) category is included for costs that cannot be directly allocated to one or more of the seven functional categories and so are reallocated across the functional categories based on the direct allocation of the other line items.

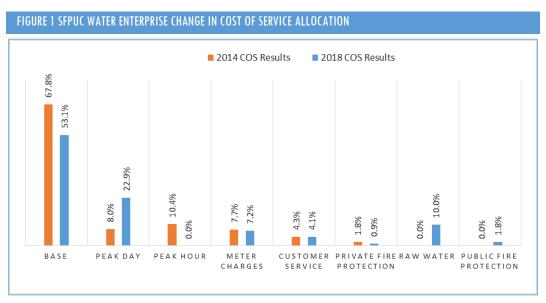

To account for possible annual fluctuations between cost categories, the forecasted expenditures were averaged over the four-year rate period of FY 2019 through FY 2022. Operating expenses, existing and future debt service, other expenses, and offsetting revenues are weighted based on their average annual expenditures over the rate-setting period to determine the overall percentage allocation. Once the overall percentage allocation to functional category has been defined, those percentages are applied to the four-year averaged revenue requirements for FY 2019 through FY 2022 in order to calculate the unit costs, as shown in Table 3.

| TABLE 3 WATER ENTER | RPRISE ALLO | ATION OF NE | T REVENUE RI | EQUIREMENTS | (FY 2019 — F | Y 2022 AVERAG | E) ⁽¹⁾ | | | | |

| M | | | | | | | | | | | |

Notes:

The SFPUC has elected to maintain a lower fixed-to-variable ratio in order to provide some revenue stability (in the form of fixed charges) while still providing adequate conservation incentives. Although a greater fixed charge can lead to greater revenue stability, a lower fixed ratio promotes affordability for low-volume users less and allows users greater control over their monthly bills. However, while the per capita water demands within the City of San Francisco are among the lowest in the country, the SFPUC must consider the possibility of further water reductions within the annual financial forecast.

Based on the result of the functional allocation, as summarized in Table 3, there is no change in the overall fixed-to-variable ratio compared to the existing cost of service despite the additional functional categories in the current study. Figure 1 illustrates that, when compared to the results from the 2014 study, the recommended functional allocation costs of the fixed components (meter charges, customer service, and both public and private fire protection) remains at approximately 14 percent. This serves as the foundation for the recommended fixed monthly service charge. As a result, the remaining variable allocation remains at 86 percent and is allocated to the base, peak, and raw water components to serve as the basis for the recommended variable commodity rates.

⁽¹⁾ Values are rounded and expressed in million dollars. Some values may not add up due to rounding.

⁽²⁾ As All Others allocation is reallocated across the other functional components.

Functional Allocation Results

Based on functional category, the units of service are volume of water consumed, meter equivalents, annual bills (based on customer accounts), and fire protection meters. In order to allocate the cost of service to various user classes, unit costs of service are developed for each functional cost component. As shown in Table 4, the total rate revenue requirements are allocated to each functional component for the four-year average. The total cost for each functional category is then divided by the total number of associated units of service to determine appropriate unit costs for the Water Enterprise. Table 4 shows the calculation of the unit costs for each functional component, which are then applied to each customer classes' projected use, accounts, and meter equivalents to derive customer class allocations for each year of the rate period.

| TABLE 4 WATER SYSTEM UNIT COST (FY 2019) (1) | | | | | | | | | | |
|--|---------------------|--|--------------------------|--------------------------|-------------------------|---------------------|------------------------|--|--|--|
| | BASE USAGE | PEAK USAGE (2) | METER CAPACITY CHARGE | CUSTOMER SERVICE | PRIVATE FIRE PROTECTION | RAW Water | PUBLIC FIRE PROTECTION | | | |

| Value Allocable to Component (A) | \$146.2 | \$63.0 | \$19.7 | \$11.3 | \$2.6 | \$27.6 | \$4.8 | | | |
| Total Units (B) | 29,574,387 | 14,494,521 | 298,594 | 1 <i>75</i> , 897 | 229,685 | 29,669,585 | 298,594 | | | |
| Allocation Basis ⁽³⁾ | Annual Use (ccf) | Annualized Max Day Excess Use (ccf) | Meter Equivalents | Customer Accounts | Hydrant Equivalents | Annual Use (ccf) | Meter Equivalents | | | |
| Per Unit Cost = A ÷ B | \$4.95 | \$4.35 | \$5.50 | \$5.34 | \$0.93 | \$0.93 | \$1.35 | | | |
| Notes. | | | | | | | | | | |

Notes:

- (1) Allocable values are rounded to the nearest million and unit costs are rounded up to the nearest \$0.01.
- (2) The SFPUC peaking factor of 1.31 times the average day demand annualized (or times 365) yields max day excess use.
- (3) Ccf is one hundred cubic feet, 1 ccf = 748 gallons.

Projections are based on current customer usage characteristics and account growth assumptions, respective to their base usage and peaking factors. Based on available consumption and customer records, Table 5 details the total units of service for each customer class and functional category in accordance with their percentage allocation. This customer data is then used to determine appropriate proportional allocation of revenue requirements to each customer class.

| TABLE 5 WATER SYSTEM ALLOCATION OF REVENUE REQUIREMENTS BY CLASS (FY 2019 — FY 2022 AVERAGE) (1) | | | | | | | | | |

| Notes: | | | | | | | | | |

(1) Values are rounded and expressed in million dollars. Values may not add up due to rounding.

The water rate design analysis determines how the costs are recovered from each customer through specified water rates. The focus of this analysis is to achieve full cost recovery and substantiate that

customers are paying their fair and proportionate share of system costs. The SFPUC's existing rate structure consists of two components: a commodity charge (variable) and a monthly service charge (fixed). The commodity component is assessed based on metered water usage per ccf and, by design, is intended to recover the cost incurred for delivering each unit of water. The monthly service charge is intended to recognize that the utility incurs fixed costs to provide the availability of water service, which must be recovered independent of monthly water demands and consumption.

Wastewater Enterprise

Carollo developed a detailed cost allocation that serves as the basis for the proposed rate adjustments. The allocation developed through this study provides an accurate method for allocating costs within the wastewater system. For the SFPUC wastewater facilities, these cost categories include flow and strengths — Chemical Oxygen Demand (COD), Total Suspended Solids (TSS), Fats, Oils, and Greases (FOG) — and Customer Service. The total flow is the sum of wet weather and dry weather volume. Wet weather is the condition when peak flow occurs such as a storm event with stormwater runoff.

Functional Cost Allocation

These five cost categories are referred to as billable constituents. In addition to these five, an AAO category is included for costs that are reallocated across every functional category. O&M expenditures and the capital costs for each debt service and future capital projects were assigned to the associated billable constituents. The SFPUC applies separate allocations for O&M and capital costs in order to more accurately reflect appropriate cost relationships. This process allows the SFPUC to recover a proportionate share of annual costs related to capital and O&M from each user through the annual user rate based on their individual flow and loading discharges.

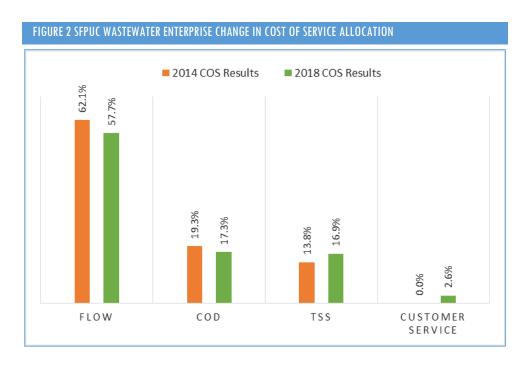

Operating expenses, existing and future debt service, other expenses, and offsetting revenues are weighted based on their average annual expenditures over the four-year rate-setting period to determine the overall percentage allocations, as shown in Table 6. Once the overall percentage allocation to functional category has been defined, those percentages are applied to the full revenue requirements for FY 2019 in order to calculate the unit costs including \$54.9 million for AAO.

| TABLE 6 WASTEWATER SYSTEM ALLOCATION OF NET REVENUE REQUIREMENTS (FY 2019 - FY 2022 AVERAGE) (1) | | | | | | | | | |
|--|---------|-----------------------|--------|--------|----------------|----------|------------|--|--|
| | | ALLOCATION VALUE (\$) | | | | | | | |

| CATEGORY | VALUE | FLOW (2) | COD | TSS | FOG | SERVICE | OTHERS (3) | | |
| Value | \$356.6 | \$174.0 | \$52.3 | \$50.9 | \$16. <i>7</i> | \$8.0 | \$54.9 | | |
| AAO Reallocation Percent | | 31.6 | 9.5 | 9.2 | 3.0 | 1.5 | (54.9) | | |
| Total Value w/ AAO | | \$205.6 | \$61.8 | \$60.1 | \$19. <i>7</i> | \$9.4 | \$0.0 | | |
| Total Percent | 100% | 57.7% | 17.3% | 16.9% | 5.5% | 2.6% | 0.0% | | |

Notes:

- (1) Value expressed in million dollars. Values may not add up due to rounding.
- (2) Flow includes the sum of dry weather and wet weather volumes.
- (3) As All Others allocation is reallocated across the other functional components.

Based on the analysis described above and Figure 2, the customer service component, which includes administrative and billing activities, represents 2.6 percent of forecasted costs and is the foundation for the recommended monthly fixed charge. The remaining 97.4 percent of costs are allocated to flow and strength components and are the basis for the recommended commodity rates.

The SFPUC currently does not have a fixed charge for the wastewater system. As part of this cost of service study, Carollo recommends the introduction of a fixed charge in order to provide additional revenue stability, and to phase in this charge over the four-year period

In order to allocate the cost of service to various customer classes, unit costs of service are developed for each functional cost component. The total cost for each functional category is then divided by the total number of associated units of service to determine appropriate unit costs for the Wastewater Enterprise. Based on functional category, the units of service are wastewater billable volume, COD mass, TSS mass, FOG mass, and annual bills (based on accounts). As shown in Table 7, the unit costs of service are developed by dividing the total annual costs allocated to each functional component by the total annual service units of the respective category.

| TABLE 7 WASTEWATER SYSTI | EM UNIT COST (FY 2019) | | | | |
|-------------------------------------|------------------------|-------------------|-------------------|-------------------|---|
| | FLOW (1) | COD | TSS | FOG | CUSTOMER SERVICE |
| Allocation Percent | 57.7% | 17.3% | 16.9% | 5.5% | 2.6% |

| Notos | | | | | | | | | |

(1) Flow includes the sum of dry weather and wet weather volumes.

(2) Values are rounded and expressed in million dollars. Values may not add up due to rounding.

The wastewater rate design analysis determines how the costs are recovered by each customer through specified wastewater rates. The commodity rate is assessed based on discharge volume and strength. A fixed charge is recommended to recognize that the utility incurs fixed costs to provide service, which must be recovered independent of discharge characteristics. These two rate components serve as a basis for the rate design.

RATE DESIGN

As the SFPUC continues to refine its rate structure based on changing demands, legal guidelines, and regulatory changes, Carollo analyzed various rate structure adjustments. Once costs have been equitably allocated to each functional component, the SFPUC has some flexibility in designing the rate structure in order to meet its various policy objectives. Several criteria were considered and discussed at length with SFPUC staff. This study and recommendations follow industry best practices and adhere to the substantive requirements of Proposition 218.

Water Enterprise

The water rate design analysis determines rates required to achieve cost recovery, proportionately for each customer. The SFPUC's existing rate structure consists of two components: a commodity charge (variable) and a monthly service charge (fixed). The commodity component is assessed based on metered water usage per ccf and, by design, is intended to recover the cost incurred for delivering each unit of water. The monthly service charge is intended to recognize that the utility incurs fixed costs to provide the availability of water service, which must be recovered independent of monthly water demands and consumption.

In an effort to reduce rate shock as a result of adjustments to the cost of service allocations, Carollo recommends transitioning the residential commodity rates from the existing rates to the cost of service rates calculated for FY 2022 over the four-year period. For this reason, the recommended rates for FY 2019 differ from the calculated rates shown throughout the Rate Design chapter. Throughout the rate-setting process, Carollo worked closely with SFPUC staff to evaluate the impact of the recommended rate structure to water customers.

Monthly Service Charge

By design, the monthly service charge includes a customer service component and a capacity component based on meter size. The customer service component recovers expenses associated with billing, collection, and customer service. This component is the same for all customers regardless of meter size. The meter capacity component captures maintenance costs related to meters and services, as well as a portion of the Water Enterprise's capital costs. This component varies based on meter size to reflect the difference in potential demand that can be placed on the system by different sized meters.

The meter (capacity) charge is then added to the customer service unit cost to calculate the total monthly service charge. The overall percentage increase in the monthly service charge for larger meters is higher

than the increase for smaller meters because the customer service and meter charge components do not increase at the same rate. The overall service charge increase is a weighted average of the two components. Since the meter charge increases with meter size while the customer service cost does not, the meter portion becomes an increasingly significant portion of the overall charge as the meter size gets larger, which results in a larger overall increase for larger meters.

Table 9 summarizes the monthly service charge during the study period, by meter size.

| TABLE 9 RECOMMEND | TABLE 9 RECOMMENDED WATER MONTHLY SERVICE CHARGES BY METER SIZE (1) | | | | | | | | | |
|-----------------------|---|----------|----------|----------|----------|--|--|--|--|--|
| METER SIZE | FY 2018 (2) | FY 2019 | FY 2020 | FY 2021 | FY 2022 | | | | | |
| 5/8 in. | \$11.63 | \$12.19 | \$13.15 | \$14.06 | \$15.04 | | | | | |

| 16 in. | 2,264.24 | 2,574.09 | 2,777.01 | 2,968.66 | 3,175.34 | | | | | |

Notes:

- (1) Charge is rounded up to the nearest \$0.01.
- (2) FY 2018 already has an approved revenue increase.

Commodity Rates

Carollo recommends the SFPUC retain its existing water rate structure for residential customers as they are designed to encourage water conservation and are charged on an inclining block rate schedule. Table 10 summarizes the recommended commodity rates during the four-year study period.

| TABLE 10 RECOMMENDED WATER COMMODITY RATES BY CUSTOMER CLASS (1) | | | | | | | | | |
|--|---|-------------|--------------|---------|---------|---------|--|--|--|
| CUSTOMER CL | ASS | FY 2018 (2) | FY 2019 | FY 2020 | FY 2021 | FY 2022 | | | |
| Residentia | I | | | | | | | | |
| SFR | Tier 1 (0 - 4 ccf) | \$6.42 | \$7.06 | \$7.77 | \$8.55 | \$9.40 | | | |
| SFK | Tier 2 (over 4 ccf) | 8.62 | 9.05 | 9.50 | 9.98 | 10.48 | | | |
| AAED. | Tier 1 (0 - 3 ccf/DU) | 6.57 | <i>7</i> .18 | 7.85 | 8.58 | 9.39 | | | |
| MFR | Tier 2 (over 3 ccf/DU) | 8.81 | 9.21 | 9.62 | 10.05 | 10.50 | | | |
| Nonreside | ntial | | | | | | | | |
| Nonresi | ercial/Industrial, Municipal, idential Irrigation, Docks & Ships, s & Contractors, Fire Service | \$7.64 | \$8.33 | \$9.04 | \$9.72 | \$10.45 | | | |
| Nonpot | table (Raw Water) | 2.95 | 0.75 | 0.81 | 0.87 | 0.94 | | | |

Notes:

- (1) Rates are rounded up to the nearest \$0.01.
- (2) FY 2018 has already approved rate increase.

Based on the cost of service analysis and single family residential (SFR) usage, SFR consumption within Tier 1 is primarily non-peak water usage and is used consistently throughout the course of the year. The Tier 1 rate is set to recover the cost of non-peak water delivery and a minimal share of peak costs, accounting for the peak demand that does occur under 4 ccf. Tier 2 then accounts for the majority of costs associated

with peaking not accounted for in Tier 1, such as costs associated with water conservation programs, groundwater production, and recycled water production.

Similar to SFR customers, MFR consumption that falls within Tier 1 would be charged at the base unit cost which is set to recover the base (non-peak) costs and accounts for a small portion of costs related to peaking or extra capacity. Based on the tier break of 3 ccf, some peaking occurs within Tier 1, which is then reflected in the Tier 1 rate. Tier 2 would account for the majority of system peaking and, accordingly, is allocated the majority of peaking costs in the recommended rate structure. Peaking costs include those related to the oversizing of infrastructure to meet peak day demands. In addition, water conservation costs are included in the Tier 2 rate to reflect the effort to reduce the water consumption of high-volume users.

Carollo recommends a single nonresidential rate that retains the existing uniform commodity rate structure. Nonpotable (raw) water is provided to two customers outside of the City and County of San Francisco in its natural state prior to any treatment. Rates recover the costs associated with the infrastructure and supply of untreated water service when the customer furnishes all facilities necessary to convey the untreated water from the system's supply reservoirs to the customer's point of use.

Wastewater Enterprise

Similar to the water rates, the current wastewater rates consist of a uniform (non-tiered) flow-based rate with an additional separate charge for each unit associated with strength for nonresidential customers. However, retail wastewater revenues are currently based entirely on flow-based charges, as there is no monthly service charge associated with the wastewater rate structure. The rate is charged based on the assumed amount of metered water usage that is returned to the wastewater system.

Monthly Service Charge

Carollo recommends implementation of a wastewater fixed monthly service charge to recover costs associated with customer service and billing. Because these costs are not related to customer flow and strength characteristics, it is recommended to implement a flat monthly charge that does not vary by meter size or customer class. The recommended monthly service charges are shown in Table 11.

Commodity Rates

Wastewater customer classes are evaluated separately to determine unit costs more specific to their customer category. Units of wastewater discharge are determined based on metered water consumption and a return-to-sewer factor (flow factor) that accounts for that a portion of water usage which does not return to the wastewater system. The return-to-sewer factor varies by customer class, recognizing the greater level of outside irrigation by single family and nonresidential users compared to MFR users. For nonresidential customers, the rate is separated into strength- and flow-based rates. The strength charges are assessed based on the estimated effluent strength discharged to the wastewater system per ccf, which is specific to user categories.

Wastewater loading strength is assumed to be similar for all residential wastewater users at 684 mg/L COD, 279 mg/L TSS, and 85 mg/L FOG. Because of this standardized assumption, the costs associated with loadings may be rolled up into one rate applied to residential users based on discharge flow. The residential rate assessed for flow includes costs associated with loadings. However, nonresidential customer loadings vary greatly so their flow rate does not include costs associated with loadings. Separate loadings charges are applied to their assumed loadings by customer type to determine the total wastewater bill. Based on the flow factor, the amount discharged is assumed to be 90 percent of monthly water consumed for single family residential customers and 95 percent of monthly water consumed for multifamily residential customers.

Nonresidential users currently pay a uniform volume rate for each unit of wastewater flow, which is based on a 90 percent return factor applied to metered water usage for nonresidential customers. In addition,

nonresidential customers are assessed separately for each billable constituent. These charges are based on the assumed loading concentrations (strength parameter) that are returned per discharge unit for various types of nonresidential customers. Defined strengths are based on periodic sampling data on an individual customer basis or the customer's Standard Industrial Classification (SIC) code, if no sampling data is available.

The recommended rates are calculated by dividing the total annual costs associated with each cost component by their associated total annual units. Nonresidential customers are billed by applying the appropriate SIC code classification to the recommended unit costs to reflect the assumed loadings concentrations specific to commercial property type. The recommended rates for FY 2019 through FY 2022 are summarized in Table 11.

| TABLE 11 RECOMMENDED WASTEWATER RATES (1) | | | | | | | | | |
|---|-------------|---------|---------|---------|---------|--|--|--|--|
| DESCRIPTION | FY 2018 (2) | FY 2019 | FY 2020 | FY 2021 | FY 2022 | | | | |
| Monthly Service Charge (\$/month) | None | \$0.99 | \$2.27 | \$3.77 | \$5.51 | | | | |
| Residential SFR (\$/ccf) | \$12.40 | \$13.28 | \$14.39 | \$15.58 | \$16.88 | | | | |
| MFR (\$/ccf) | 12.40 | 13.28 | 14.39 | 15.58 | 16.88 | | | | |
| Nonresidential | | | | | | | | | |
| Flow (\$/ccf) | 7.66 | 8.16 | 8.734 | 9.34 | 9.99 | | | | |

| FOG (\$/lb) | 1.082 | 1.221 | 1.380 | 1.558 | 1.757 | | | | |

Notes:

Drought Surcharge

To enhance revenue stability for wastewater operations, Carollo recommends the SFPUC implement drought surcharges to be applied to both water and wastewater rates during periods of reduced water demand, and therefore reduced wastewater flows, associated with drought conditions. A drought surcharge will allow the SFPUC to address revenue shortfalls driven by sustained decreases in sales due to drought, supply limitations, or other circumstances, and would only be assessed if SFPUC declares water supply shortages while also continuing to incentivize water conservation.

⁽¹⁾ Strength unit costs are rounded up to the nearest \$0.001, other charges are rounded up to the nearest \$0.01.

⁽²⁾ FY 2018 has already approved rate increase.

Customer Impacts

Figure 3 illustrates the impact of the recommended rates on the combined water and wastewater bill for SFR customers with a 5/8-inch meter across various usage levels.

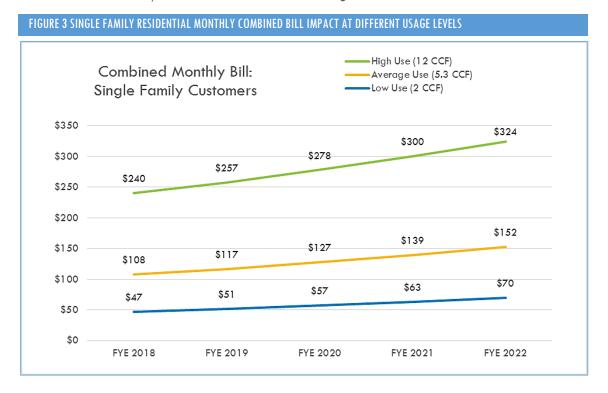

Figure 4 illustrates the impact of the recommended rates on the combined water and wastewater bill for MFR customers with a 5/8-inch meter across various usage levels.

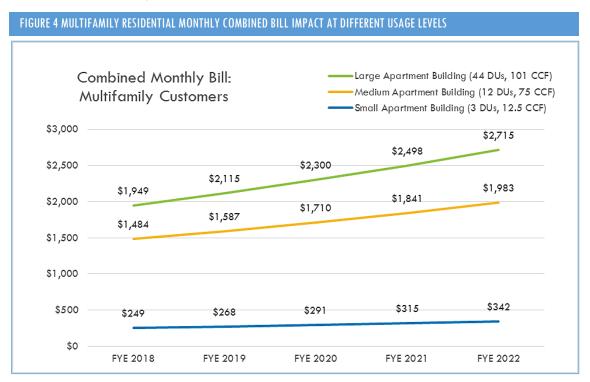

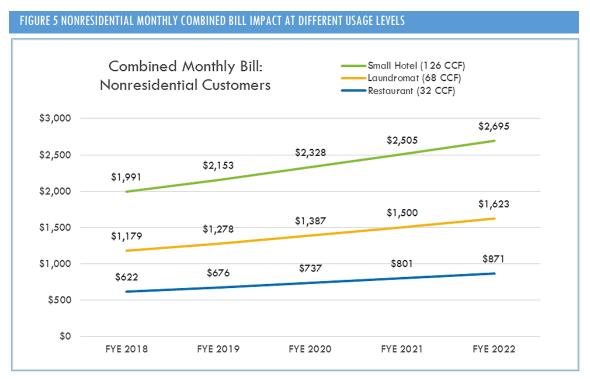

Figure 5 illustrates the impact of the recommended rates on the combined water and wastewater bill for nonresidential customers with a 5/8-inch meter across various usage levels and business types.

CAPACITY CHARGES

A Capacity Charge is designed to recover a fair and proportionate share of the costs to provide capacity to serve future users, and is imposed as a condition of service for new wastewater usage, increase in usage, or change in usage. The SFPUC adopted a Wastewater Capacity Charge in July 2005 and a Water Capacity Charge in 2007. The capacity charge adopted by the SFPUC is based on the Equity Buyln methodology. Conceptually, this methodology requires future users to buy into the system at a value commensurate to the equity contributed by existing users. Capacity Charges are calculated by dividing ratepayer equity by the total system capacity of the wastewater or water system. Ratepayer equity is defined as the value of the existing system, including construction work-in-progress and cash reserves, less outstanding debt principal and accumulated depreciation. Total system capacity is defined as the number of 5/8-inch meter equivalents (ME) that can be served by the existing system.

Capacity Charge Methodology

The equity buy-in approach requires that new users buy into the water or wastewater system on par with the average equity that existing users have funded through rates and charges. Ratepayer equity comprises two components: net capital asset equity and reserves. Net capital asset equity represents the current value of the physical water or wastewater assets funded by existing ratepayers, net of accumulated depreciation. Capital costs not funded by existing ratepayers, such as grant-funded assets, are excluded from the ratepayer equity component. Additionally, capital costs financed through bonds are reduced by the total of the outstanding debt principal to reflect those costs not yet paid for by ratepayers. The Capacity Charge calculation includes only the net capital assets associated with the portion of the SFPUC system that provides service to Inside City and suburban retail customers. Regional and wholesale assets are not included.

Recommended Capacity Charges

The water and wastewater capacity charges are calculated by dividing the ratepayer equity by total system capacity, as illustrated in Table 12. The significant increase in the water capacity charge is primarily due to the projects associated with the WSIP rolling onto the asset list. However, the accumulated depreciation is not increasing as much because a large number of assets that are fully depreciated.

| TABLE 12 CAPACITY CHARGE CALCULATIONS | | |
|---------------------------------------|-----------------|-------------------|
| DESCRIPTION | WATER SYSTEM | WASTEWATER SYSTEM |
| Ratepayer Equity | \$1,156,390,852 | \$2,237,148,517 |
| Number of MEs | 635,000 | 468,000 |
| Calculated Capacity Charge per ME | \$1,821 | \$4,780 |
| Existing Capacity Charge per ME | \$1,346 | \$4,583 |
| Capacity Charge Increase (%) | 35% | 4% |

The methodology described above results in a calculated maximum Water Capacity Charge of \$1,821 for a 5/8-inch ME and a calculated Wastewater Capacity Charge of \$4,780 for a 5/8-inch ME with SIC 4 classification. Carollo recommends adopting the maximum calculated Capacity Charges. Detailed calculations and recommended Capacity Charge schedules are provided in the Capacity Charge chapter of this report.

Water Capacity Charge

Based on the calculation shown in Table 12, Carollo recommends that the SFPUC adopt a water capacity charge of \$1,821 per 5/8-inch ME. Table 13 shows the recommended water capacity charges for all meter sizes based on the ratio of the AWWA standard maximum flow rate through each meter size to the maximum flow rate through a 5/8-inch meter.

| METER SIZE | AWWA MAXIMUM FLOW RATE (GPM) | METER EQUIVALENT RATIO | EXISTING CAPACITY CHARGE | RECOMMENDED CAPACITY CHARGE |
|-----------------------|---------------------------------|------------------------|--------------------------|-----------------------------|
| 5/8 in. | 20 | 1.0 | \$1,346 | \$1,821 |
| 3/4 in. | 30 | 1.5 | 2,020 | 2,732 |
| 1 in. | 50 | 2.5 | 3,369 | 4,553 |
| $1 - \frac{1}{2}$ in. | 100 | 5.0 | 6,734 | 9,105 |
| 2 in. | 160 | 8.0 | 10,776 | 14,569 |
| 3 in. (1) | 320 | 16.0 | 20,204 | 29,137 |
| 4 in. | 500 | 25.0 | 33,673 | 45,527 |
| 6 in. | 1,000 | 50.0 | 67,349 | 91,055 |
| 8 in. | 1,600 | 80.0 | 107,758 | 145,687 |
| 10 in. | 2,500 | 125.0 | 154,821 | 227,636 |
| 12 in. | 4,300 | 215.0 | 289,448 | 391,534 |
| 16 in. | 7,500 | 375.0 | 504,852 | 682,909 |

Notes:

Wastewater Capacity Charges

Carollo recommends that the SFPUC adopt a wastewater capacity charge of 4,780 per 5/8-inch ME based on the calculation in Table 14 and Table 15 present the recommended wastewater capacity charge by meter size and SIC Group, based on the calculated maximum capacity charge per ME.

⁽¹⁾ Carollo gathered data from the meter group for meter type and size accuracy. Adjustments were made to the 3-inch meter and the 10-inch meter ratios, due to these clarifications.

| TABLE 14 RECOM | IMENDED WAST | EWATER CAPACITY C | HARGE SCHE | EDULE UP TO SIC 6 | | | |

Capacity Charge Comparison

Carollo conducted a survey of nearby utilities to gather information about their water and wastewater capacity charges. Although utilities are not always alike, it is common to examine comparisons between similar or neighboring utilities. Figure 6 summarizes combined typical water and wastewater capacity charges per equivalent dwelling unit (EDU) within the Bay Area. Care should be taken in drawing conclusions from such comparisons as factors including locations, customer profiles, age of the system, and various operational and capital-related needs vary from agency to agency. As illustrated, despite the recommended increase to customers, capacity charges are below the average of nearby agencies.

FIGURE 6 WATER CAPACITY CHARGE SURVEY OF BAY AREA UTILITIES

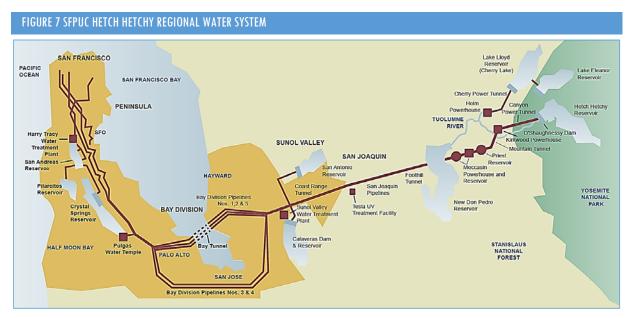

2. BACKGROUND AND SYSTEM OVERVIEW

The SFPUC is an enterprise department of the City and County of San Francisco that provides water, wastewater, and municipal power services to San Francisco. The SFPUC is responsible for the maintenance, operation, and development of three utility enterprises: the Water Enterprise, the Wastewater Enterprise, and the Power Enterprise. The SFPUC's enterprises are operated and managed as separate financial entities with separate enterprise funds.

The Water Enterprise provides drinking water to retail customers in the City, to certain retail customers outside the City and to wholesale customers in three other Bay Area counties. This Enterprise is responsible for the daily O&M, and for the long-term planning of water supply, treatment, and distribution facilities for the City and County of San Francisco and contract wholesale customers. The Wastewater Enterprise provides wastewater and storm water collection, treatment and disposal services for the City. The Wastewater Enterprise is responsible for the daily O&M, and for the long-term planning of sewer collection, treatment, and disposal facilities for the City and County of San Francisco.

WATER SYSTEM

The SFPUC is the largest water purveyor in Northern California, serving a population of nearly 2.7 million people in over 30 cities. Customers are divided into three categories: retail customers in the City and County of San Francisco, wholesale customer agencies on the San Francisco Peninsula, in the South Bay and parts of the East Bay, and the retail customers outside of San Francisco. About one-third of SFPUC's water supply is served to retail customers, the remaining two-thirds is served to wholesale customers. Source water comes from three systems. These are the Hetch Hetchy system (Hetch Hetchy, Lake Lloyd, and Lake Eleanor Reservoirs), the Alameda Reservoirs (Calaveras and San Antonio), and the Peninsula Reservoirs (Crystal Springs, Pilarcitos, and San Andreas).

Average annual water production of the SFPUC is approximately 300 million gallons per day (MGD). About 85 percent is derived from the Hetch Hetchy system, 10 percent from the Alameda Reservoirs, and 5 percent from the Peninsula Reservoirs.

Water System Improvement Program

The Waster System Improvement Program is a \$4.8 billion multi-year capital program to enhance SFPUC's ability to provide reliable, affordable, high quality drinking water to its 27 wholesale customers and regional retail customers in an environmentally sustainable manner. The recommended WSIP is structured to meet water quality regulatory requirements, improve seismic and delivery reliability, and meet water supply reliability goals.

Projects within the WSIP continue to incorporate key principles of SFPUC centered on sustainability, reliability, and quality. The objectives of the program are to:

- Improve the system to provide high-quality water that reliably meets all current and foreseeable local, State, and Federal requirements.
- Reduce vulnerability of the water system to damage from earthquakes.
- Increase system reliability to deliver water by providing the redundancy needed to accommodate outages.
- Provide improvements related to water supply/drought protection.
- Enhance sustainability through improvements that optimize protection of the natural and human environment.

As of December 2017, the WSIP is approximately 95 percent complete. Eight regional projects are in construction and 39 projects are in close-out or have been completed. 40 out of 43 regional WSIP projects with specific level of service goals have been achieved to date. Besides the WSIP closeout projects, the only regional project that remains in pre-construction is the Alameda Creek Recapture Project.

Wastewater System

The wastewater collection, treatment, disposal, and reuse system consists of a combined sewer system that treats both sanitary sewer and wet weather flows. It also includes three water pollution control plants, and effluent outfalls to the San Francisco Bay and Pacific Ocean. The combined sewer system reduces pollution in the San Francisco Bay and Pacific Ocean by treating wet weather flows, and urban runoff that would otherwise discharge to the Bay and Ocean. The collection system consists of approximately 900 miles of sewer system lines throughout the City. The SFPUC treats all sanitary flows during dry weather months before discharging the treated effluent to the Pacific Ocean and San Francisco Bay.

Dry weather flows, including street runoff, receive full secondary treatment at either the Oceanside or Southeast wastewater treatment plants. Wet weather flows receive either secondary treatment at Oceanside or Southeast facilities, or primary treatment at the North Point wet weather facilities.

WESTSIDE Richmond North Share Shar

Sewer System Improvement Program

The SSIP is a 20-year citywide investment to upgrade and replace vital sewer infrastructure. Annual capital expenditures will increase substantially in upcoming years due to the 20-year SSIP. The SSIP is divided into three overlapping phases. In 2012, the Phase 1 Capital Budget Plan was approved for a total budget of \$2.91 billion and is 21.1 percent complete as of the end of FY 2017. The expected completion for SSIP Phase 1 is October 2026. All three phases are expected to total nearly \$7 billion, funded through a combination of new debt issuances and cash sources including operating revenues, capacity charges, and other sources.

In developing the SSIP, the SFPUC has endorsed specific, measureable goals and objectives that will guide project selection and will be utilized to evaluate program implementation and success. The level of funding needed to support the SSIP is the basis for the analysis of sewer system rates and charges developed in this study.

3. WATER ENTERPRISE REVENUE REQUIREMENTS

Carollo Engineers (Carollo) analyzed the revenue requirements of retail customers to test the fiscal health of the SFPUC Water Enterprise, evaluate the adequacy of current rate levels, and set the basis for near-and long-term rate planning. The revenue requirement analysis covers the study period FY 2018 through FY 2028. The primary focus for rate setting was given to four years, FY 2019 through FY 2022, of the study period as the SFPUC already has an approved rate increase for FY 2018. Based on the findings of this study, Carollo recommends the Water Enterprise increase retail rates by an average of 7.5 percent over the four-year period from FY 2019 though FY 2022 in order to fund operational and capital needs, and meet debt service obligations associated with the \$4.8 billion WSIP and other infrastructure priorities. The proposed findings support the Water Enterprise's ability to continue meeting its level of service objectives.

REVENUE REQUIREMENTS OVERVIEW

The revenue requirement analysis compares the forecasted revenues of the utility to its forecasted operating and capital costs to determine the adequacy of the existing rates to recover the utility's costs of providing service. Should any deficits be identified, additional funding, either through rates or additional bond issuances, are reviewed and recommended based on strategic goals and available funding. Through its annual budgeting process, the SFPUC performs a detailed review of its costs, including operations expenses, capital needs, and reserve requirements. The revenue requirements analysis determines the annual retail revenue necessary to be recovered through water rates and charges in order to meet the Water Enterprise's expected financial obligations.

Carollo examined the SFPUC's FY 2019 budget expenses as the base year for operation and O&M costs and worked with the SFPUC to forecast total expenses. Carollo also collected information related to current reserve fund balances, budgeted CIP expenses, future expenses, future revenues, and miscellaneous financial information. Once the revenue requirement is established by compiling all of the SFPUC's cost drivers, two tests are utilized to determine whether the annual revenues are sufficient: cash flow test and debt coverage test. Should both tests "fail," the test with the larger deficiency is determined to be the primary driver. Based on the results of the baseline revenue requirement analysis, the main driver in the first few years is the debt coverage requirement, and in later years cash flow drives the need for additional revenue.

Cash Flow Test

The cash flow sufficiency test evaluates whether revenues exceed expenses for a net positive cash flow at the end of each fiscal year. When they do not, this test is not passed, and additional rate revenue is recommended. The cash flow test identifies the amount of annual revenues that must be generated in order to meet annual expenditure obligations. These obligations include O&M expenses, debt service payments, policy-driven minimum reserves, and rate-funded capital expenses. These expenses, less offsetting revenues from other sources, are compared to total annual projected retail rate revenues. Deficits are then used to estimate the need for rate revenue increases. The analysis also considers existing reserves and financial policies to help mitigate or smooth the need for rate adjustments in the short-term. Within the SFPUC's Fund Balance Reserve Policy, it states that excess reserve amounts will be considered for contingencies and rate stabilization. As such, the SFPUC has the ability to use unrestricted reserves, if available, to satisfy the annual cash flow test in order to minimize rate spikes.

Debt Coverage Test

The second test is the debt service coverage test, which measures the ability of a utility to meet both legal and policy-driven revenue obligations. Many agencies use bonded indebtedness to fund a portion of their capital expenses. Debt service coverage is dictated by each agency's bond covenants and establishes an amount that a borrower must raise in revenue in excess of operations and debt-related expenses. Debt issuance is a significant funding source for the SFPUC's capital programs.

Under the SFPUC water indenture, revenues pledged to cover debt service must meet two separate ratios: (1) current and (2) indenture.

1. Current coverage requires annual revenues to meet a minimum of 1.00x (times) the annual debt service. This measure looks at only current year revenues and may exclude certain revenues and expenditures, depending on the covenant.

$$\frac{\textit{Current}}{\textit{Coverage}} = \frac{(\textit{Annual Revenues} - \textit{Operating Expenses})}{\textit{Annual Debt Service}}$$

2. By indenture, the SFPUC is required to collect sufficient net revenues to meet or exceed 1.25x the annual debt service. This measure includes current year revenues including the unappropriated fund balance for debt service coverage sufficiency.

$$\frac{\textit{Indenture}}{\textit{Coverage}} = \frac{(\textit{Annual Revenues} - \textit{Operating Expenses}) + \textit{Unappropriated Fund Balance}}{\textit{Annual Debt Service}}$$

However, to ensure that the SFPUC retains financial flexibility for contingencies, the Commission has adopted and implemented a Debt Service Coverage Policy that targets higher metrics than the minimum debt service coverage requirements. The SFPUC has adopted a current coverage ratio of 1.10x and indenture coverage ratio of 1.35x. This means that the SFPUC must raise enough revenue to cover all operations and maintenance expenses, including debt service, plus an additional 10 basis points for debt service with revenues. Similarly, the indenture coverage ratio requirement, which includes revenues and unappropriated fund balance to cover all operations and maintenance including debt service, also was raised an additional 10 basis points over requirements.

ANALYSIS ASSUMPTIONS AND INPUTS

Water Enterprise Baseline Inputs

The Water Enterprise provides potable water to retail customers within the City, to certain retail customers outside the City, and to wholesale customers in Alameda, San Mateo, and Santa Clara counties. Customers are divided into three categories: 1) inside City and County of San Francisco retail customers; 2) wholesale customer agencies on the San Francisco Peninsula, in the South Bay, and parts of the East Bay; and 3) retail customers outside of San Francisco.

Table 16 summarizes the number of accounts and the demand for SFPUC's retail water customers by customer class.

| | NUMBER OF | FY 2017 |
|------------------------------------|-----------|------------|
| CUSTOMER CLASS | ACCOUNTS | DEMAND (1) |
| Single Family Residential (SFR) | 110,951 | 6,897,757 |
| Multifamily Residential (MFR) | 37,002 | 10,497,591 |
| Residential Irrigation | 296 | 125,156 |
| Commercial/Industrial | 16,411 | 9,196,666 |
| Municipal | 1,174 | 914,093 |
| Nonresidential Irrigation | 1,269 | 802,897 |
| Docks & Ships | 7 | 3,585 |
| Builders & Contractors | 136 | 75,762 |
| Fire Service | 8,475 | 24,351 |

(1) Measured in billing units of one hundred cubic feet (ccf).

Forecast Assumptions

The SFPUC's FY 2019 operating budget served as the basis for forecasting future operating expenses for the Water Enterprise. The budget was compared to the current internal financial forecast and discussed with SFPUC staff to identify expenses that may need to be adjusted or are not appropriate to include when projecting into future years. This includes any incremental costs due to the WSIP. The escalation factors used in this analysis are based on input from the SFPUC staff and a review of both the long-term and recent cost escalation from the Engineering News-Record Construction Cost Index (ENRCCI), an industry benchmarking resource. The escalation factors are presented in Table 17.

| Table 17 Water Enterprise Escalation Factors | | | | | | | | |
|--|--|--------------------|--|--|--|--|--|--|
| ESCALATION FACTOR | DESCRIPTION | ESCALATION Rate | | | | | | |
| General Cost Inflation | Long-range O&M growth. | 3.0% | | | | | | |
| Account Growth | Number of accounts will increase by this factor. | 0.1% | | | | | | |
| Demand Growth/(Reduction) | Consumption per account will increase/(decrease) by this factor. | (0.5)% | | | | | | |
| Retail Rate Increase | Increase in water rate due to changes in revenue requirements. | Varies | | | | | | |
| Operating Expenses Increase | Increase in operating and maintenance costs. | Varies | | | | | | |
| Total Expenses Increase | Increase in all operating and non-operating expenses costs. | Varies | | | | | | |

The SFPUC individual line item costs were assigned one of the escalation factors shown in Table 17 to account for variability among cost categories. These escalation factors were then applied to the appropriate categories of expenses to forecast costs incurred by the Water Enterprise.

Forecasting Water Enterprise Expenses

Operating expenses are costs that the utility incurs for daily operations, such as personnel salaries and benefits, system maintenance, fuel, and chemicals. As part of the budget process, an O&M forecast is developed for the Water Enterprise. The operating budget expenses include costs related to the following main categories listed below:

- 1. Administration: Much of the SFPUC's overhead cost allocation and related labor costs. These are labor costs that cannot be directly allocated to a function, such as treatment or pumping, but still support the daily operations.
- 2. Water Supply and Treatment: Raw surface water supply and water produced from the SFPUC's wells must be treated. Costs in this category cover the operational costs of plants involved in the treatment process.
- 3. Pumping and Transmission: Costs associated with the distribution of water outside the fence of the SFPUC's treatment facilities. Pumping covers the energy and maintenance costs.
- 4. Distribution and Storage: Distribution covers the O&M of below ground assets beyond the treatment plant. Storage covers the O&M of storage tanks, reservoirs, and other facilities to hold treated water throughout the year and allow consistent supply availability.

In future years, additional incremental O&M costs associated with capital assets from the WSIP are expected. These will be in addition to the escalated O&M costs discussed above. For FY 2019, the total O&M cost of the Water Enterprise, including Programmatic Expenses, is budgeted at \$271.3 million. Costs for FY 2020 through FY 2028 were estimated using the FY 2019 budget and applying appropriate annual escalation factors presented in Table 17.

Table 18 presents a summary of the Water Enterprise's operating expenses.

| Table 18 Water Enterprise Operating Expenses (1) | | | | | | | | | | | |

Forecasting Water Demand and Supply

Per capita water use within San Francisco continues to be among the lowest in the State and below historic consumption. Both total consumption and per capita water use have been on a general decline over the recent decades. Many factors have contributed to this reduction in water use, including significant changes to the mix of industrial and commercial businesses and their associated water demand and the general characteristics of water use. Under the 2015 Urban Water Management Plan for the City and County of San Francisco, the SFPUC aims to diversify its water source portfolio.

To protect from disruption of supply due to climate change, drought, and natural disaster, the SFPUC is pursuing new local water sources through groundwater wells, recycled water for irrigation, and a continued water conservation program.

Water Demand

As part of this analysis, SFPUC requested that Carollo build a probabilistic demand forecast in order to project demands over the next several years. A time-series forecasting model was developed to review historical demand levels. The model was then used to project a range of potential demand levels. The forecast was developed using only historical water consumption data, and no additional data, such as population growth or climate impacts, was incorporated. Demand data from FY 2012 through FY 2017 was used to build the model. For FY 2018 and FY 2019, the model projected total demand of 28.5 and 27.2 million ccf, respectively, a decrease of approximately 5 and 10 percent from FY 2017 (30.1 million ccf). The 95 percent confidence interval for the FY 2019 projection was 23.9 to 30.9 million ccf.

After reviewing the results of the model, it was determined that the results were unrealistically low. The high end of the FY 2019 forecast is just on par with the FY 2017 actual demand. While it is possible that demands will continue to fall through FY 2019, given the post-drought bounce-back in demand seen by many California Water agencies, it is more likely that demands will either stay flat or increase modestly. With the forecast placing a low probability on that outcome, it is likely an unreliable model without adjustments. Furthermore, the overall trend line of the data feeding the model is downward sloping, with each year since FY 2013 lower than the prior year. From FY 2012 to FY 2017, overall demands fell by approximately 18 percent, before accounting for service area growth. As a result, the forecast model is heavily swayed by recent conservation.

However, our projections should include the possibility of the state of emergency reoccurring. If a new drought were to occur, as many of the easiest and most impactful changes have already been implemented, it would be less likely to see reductions of the same magnitude as those recently experienced without dramatic decreases in population or living standards which are not expected. Therefore, Carollo assumed a relatively flat trend line going forward.

In addition to the Time-Series trending, Carollo applied a simple 0.5 percent annual reduction factor uniformly to all demand to reflect price elasticity and isolate certain likely demand drivers such as demand reductions driven by drought-related regulatory restrictions on water use, low-flow fixtures, or environmental consciousness. The projected average annual demands for the FY 2019-FY 2022 rate period are shown in Table 19.

| Table 19 Projected Water | Demands |

Water Supply

The SFPUC's primary water sources are the Hetch Hetchy Regional Water System and the Alameda and Peninsula watersheds. Hetch Hetchy provides approximately 85 percent of San Francisco's total water needs. The surface water in the Hetch Hetchy Reservoir is treated but does not require filtration. The Alameda and Peninsula watersheds produce approximately 15 percent of the total water supply as summarized in Table 20.

| Table 20 Projected Water S | Supply Summary |
|---------------------------------------|-----------------------------------|
| SUPPLY SOURCE | ANNUALLY IN FY 2019 - FY 2022 (1) |
| Hetch Hetchy (85%) | 25,611,908 |
| Alameda & Peninsula (15%) | 4,519,748 |
| Total (100%) | 30,131,656 |
| Notes: | |
| (1) Measured in billing units of ccf. | |

In an effort to conserve the drinking water supply, the SFPUC has developed alternative water supplies to serve customers. The Harding Park Recycled Water Project was completed in 2012 and the Pacifica Recycled Water Project in 2014. Together they can produce and deliver over 2.8 MGD of recycled water for irrigation of golf courses. In early 2017, the San Francisco Groundwater Supply Project began blending local, sustainable groundwater into San Francisco's current drinking water supply. At the completion of the project in 2021, this supplemental supply will add up to 4 MGD to serve the City's water demands. Once completed in 2020, the Westside Recycled Water Project will deliver recycled water and save up to 2 MGD of drinking water that is currently used for non-drinking purposes such as irrigation and toilet flushing.

Capital Improvement Program

Charter Section 8B.123 requires the SFPUC Financial Services staff to develop a Long-Term Capital Improvement Program ("10-Year Capital Plan" or "Capital Plan") and a Long-Range Financial Plan ("10-Year Financial Plan" or "Financial Plan"). In addition, Charter Section 8B.123 requires that the Commission hold public hearings on an annual basis to review, update, and adopt the Capital Plan and the Financial Plan. The Capital Plan contains a list of projects to be executed during the planning horizon, including cost estimates and schedules. The Financial Plan contains estimates of operations and maintenance expenses, repair and replacement costs, debt costs, and rate increases. Together, these two plans serve as a basis and supporting documentation for the Commission's capital budget and issuance of revenue bonds and other indebtedness.

As of December 2017, the WSIP is approximately 95 percent complete. Eight regional projects are in construction and 39 projects are in close-out or have been completed. 40 out of 43 regional WSIP projects with specific level of service goals have been achieved to date. Besides the WSIP closeout projects, the only regional project that remains in pre-construction is the Alameda Creek Recapture Project. The CIP consists of projects that enhance the SFPUC's ability to provide drinking water in an environmentally sustainable manner to its 2.7 million residential, commercial, and industrial customers in the Bay Area. The WSIP is paid for by both retail customers in San Francisco and wholesale customers and provides regional water supply reliability including supply, transmission, treatment, and regional storage.

In the 10-year CIP, future capital projects are assumed to benefit local or regional customers. The wholesale customers only benefit from the regional projects and thus are only financially responsible for their portion of these projects. As defined by the SFPUC, these projects are funded either with revenues (non-debt capital) or through revenue bonds. Those that are funded via future revenue bonds are allocated to retail and wholesale customers in a similar manner to the existing debt payments. All debt associated with regional projects are allocated to retail and wholesale customers proportional to their assumed annual water consumption. The SFPUC's latest CIP covers FY 2019 though FY 2028 and identifies a range of capital needs. A summary of the estimated CIP during the study period is provided in Table 21.

(1) Values are in million dollars and rounded. Values may not add up due to rounding.

Programmatic (non-capital) projects differ from capital projects in that they primarily achieve a programmatic goal such as changing or improving an existing asset to meet new program requirements, or creating a new one to do so. Programmatic projects may also improve conditions, accommodate changes in services or customer base, or increase or maintain federal reimbursement.

Regional Project Wholesale Funding

Similar to operating costs, capital expenses are allocated between retail and wholesale customer categories. All local projects are funded solely through retail rates, while the regional projects are split between wholesale and retail customers proportionate to their total annual deliveries.

Policy Requirements and Debt Coverage

Policy and Legal Compliance

As of the beginning of FY 2018, the SFPUC Water Enterprise's available reserves totaled approximately \$174 million. These reserves act in part as an operating reserve. Per SFPUC policy, the amount held in these reserves must be equal to or exceed 25 percent of operating expenses; however, the SFPUC currently exceeds this policy requirement and has accordingly planned to cash fund a portion of retail ratepayers' share of future capital projects using available reserves.

Based on existing debt covenants, the SFPUC is required to maintain at least 1.00x coverage ratio of annual debt service inclusive of current reserves. As described previously, this coverage is calculated as the ratio of net revenues available after O&M and debt service, including current reserves, to total annual debt service requirements. Per SFPUC policy, a target of 1.10x has been defined to allow greater flexibility and allowance for future debt issues. In addition, by indenture, the SFPUC maintains at least 1.25x coverage ratio of net revenues for operating expenses, including reserves, to total annual debt service requirements. Similarly, the SFPUC has a policy target of 1.35x. The actual coverage ratios, are expected to be 1.33x (current) and 2.00x (indenture) for FY 2018.

Debt Service

The SFPUC finances major capital improvements, in part, by issuing debt for two primary reasons. First, given the size of the capital program, the SFPUC does not have the available financial reserves that would otherwise be required to fund CIP, nor would it be reasonable to increase the water rates and charges in order to cash fund these improvements. Second, spreading the debt service costs for long-lasting projects over the repayment period provides intergenerational equity by effectively spreading the financial burden between both existing and future users of the system. This approach allows the SFPUC to better match the cost of improvements with the customers benefitting from the improvements. Table 22 summarizes the retail customer share of debt. Applying these percentages and using a weighted average, retail customers are responsible for 44 percent of the annual payment for existing debt for FY 2019.

| Table 22 Re | etail Cust | tomer An | nual Res | ponsibilit | y for De | bt Servic | e Payme | ents on C | Outstandii | ng Debt | (1) |

| Notes: (1) Values are in | million do | ollars and r | ounded | | | | | | | | |

Each capital project is allocated to either local retail or wholesale customers based on direct benefit, or it is considered a regional project and is allocated to retail and wholesale customers based on proportional benefit. Consequently, wholesale customers are only responsible for costs associated with direct wholesale projects and a portion of regional projects proportional to their water consumption.

In addition to issuing debt, the SFPUC funds a portion of improvement projects with current year revenues. The recently adopted Capital Financing Policy requires 15-30 percent of CIP to be funded with rate revenue (non-debt capital) over the 10-year capital and financial planning time horizon. The amount of

capital projects funded using current year revenues has been determined by the SFPUC, and the revenues are delineated as either local or regional, depending on the associated projects. Carollo recommends the SFPUC continue to maintain an active non-debt capital program, rather than relying exclusively on debt, which would spread replacement costs to future generations.

REVENUE REQUIREMENTS

Pre-Rate Increase Revenue Requirements

Based on the projections in this analysis, the SFPUC must increase rates annually in order to meet projected revenue needs due to annual increases in expenses. Beyond retail water rates and charges, the SFPUC collects revenues through other funding sources, such as capacity charges, Build America Bonds (BABs), capital interest earnings, connection charges, lease revenues, and revenues from wholesale customers.

Wholesale and Offsetting Revenue

These offsetting revenues reduce the total rate revenue that must be collected from retail customers. The SFPUC entered into a WSA in 2009 that details the annual wholesale revenue requirements to be collected from wholesale agencies. The revenues collected from the wholesale customers are based on calculations for determining the Wholesale Revenue Requirement (WRR) set forth in the WSA between the SFPUC and the Bay Area Water Supply Conservation Agency (BAWSCA). It is necessary to estimate projected wholesale revenues, as they are an offset to the retail revenue requirement. While other offsetting revenues may be adequately predicted by escalating current year revenues, because the wholesale revenues are based on actual annual demands, they can vary significantly each year. Table 23 shows the water enterprise revenue requirement shortfall assuming no retail rate increases.

| Notes: | | | | | | | | | | | |

Notes:

- (1) Values are in million dollars and rounded. Values may not add up due to rounding.
- (2) Wholesale sales reflect previously adopted wholesale rate increases.
- (3) Operating Expenses includes Programmatic Expenses.

As illustrated, the current retail rates are not sufficient to fully fund all annual cash needs of the utility over the next ten years. Before considering rate smoothing, increases are generally calculated using the test (cash or debt) with the greatest deficiency.

Revenue Requirements with Rate Increase

Carollo recommends annual rate increases with the resulting cash flow represented in Table 24 for the Water Enterprise. The recommended rate revenue increases average 7.5 percent per year over the next five years, aimed at ensuring that the SFPUC collects sufficient funds to pay operational and capital expenses, including the debt service obligations associated with the CIP.

Notes:

As noted earlier, the SFPUC will be required to revisit this forecast if revenues do not materialize as projected. It is important that the SFPUC maintain a 1.10x (current) and 1.35x (indenture) coverage ratio of annual debt service per its policy. If SFPUC revenues are insufficient to meet its debt coverage requirement of 1.00x (current) and 1.25x (indenture), its credit rating could be downgraded, which could have significant interest rate cost impacts due to the amount of debt expected to be issued in upcoming years. Table 24 also shows the resulting operating reserve fund from the cash flow for the Water Enterprise. SFPUC policy is for excess reserves (beyond the 25 percent target) to be considered for contingencies and rate stabilization.

⁽¹⁾ Values are in million dollars and rounded. Values may not add up due to rounding.

⁽²⁾ Prior to this study, SFPUC approved a 7% rate increase in FY 2018.

⁽³⁾ Wholesale sales reflect previously adopted wholesale rate increases.

The recommended revenue increases shown in Table 24 were determined using industry-accepted best practices and methodologies. SFPUC staff worked closely with Carollo to review all data, assumptions, and calculations that resulted in the recommendations outlined in this report. Carollo further recommends that the SFPUC review and update the financial plan and revenue requirements annually to recognize changes in customer billing data, operating expenditures, changing water sales demands, and capital improvement needs.

4. WATER COST OF SERVICE ANALYSIS

The cost of service analysis serves as a rational basis for distributing the full costs of SFPUC's services to each customer class in proportion to the demands placed on the system. Carollo developed a detailed cost allocation that serves as the basis for the proposed rate adjustments. This analysis yields an appropriate method for allocating costs, based on the current operations of the SFPUC's system. All cost allocations are consistent with the legal proportionality requirements of Proposition 218 and were reviewed for compliance with recent legal decisions regarding water rates in California.

The cost of service analysis employs a tailored review of costs with a step-by-step approach. Based on the revenue requirement analysis outlined in its respective chapters, the functional allocation designates each budget item to an SFPUC functional category, which is then translated into a specific cost/rate component. Those functional categories and their associated costs are allocated to the distinct customer classes based on each class' unique account, meter, and demand characteristics. A customer class consists of users that commonly create or share responsibility for certain costs incurred by the utility, which is determined by customer consumption data (including peak demand) in order to combine similar groups of customers.

Carollo determined the appropriate SFPUC customer classes based upon customer

Revenue Requirement

SFPUC's budget and funding goals outline the needed rate revenue.

Functional Allocation

The revenue requirement is assigned to functional categories on a line-by-line basis.

Cost Component Allocation

The functional categories are allocated to cost components based on engineering standards.

Customer Class Allocation

The cost components are reallocated to each class based on demand profiles.

Rate Design

The results of the customer class allocation form the basis of the rate design.

peaking and usage characteristics. The rate design process establishes a rate structure that proportionately recovers costs from customer classes and customers within each customer class. The final rate structure and rate recommendations are designed to (1) fund the utility's projected costs of providing service, (2) proportionally allocate costs to system customers, and (3) provide a reasonable balance of revenue stability while encouraging conservation. The rate design will be further detailed in the next chapter of this study.

FUNCTIONAL COST ALLOCATION

Functional Cost Categories

The functional cost allocation assigns the revenue requirement averaged over the four-year period, FY 2019 - FY 2022, by major function. The study developed a list of functions specific to the SFPUC's water system. Each functional component is allocated to specific cost components, which can easily be assigned to rates. The functional components used for the SFPUC were:

Supply – Surface Water: Costs associated with raw water infrastructure up to the intake structure. This also includes traditional reservoirs and storage.

Supply – Other: Costs associated with pumping, treating, delivering, or monitoring recycled water, groundwater, or any other "alternative" water sources to customers.

Natural Resources: Costs associated with watershed protection to maintain surface water quality. Interpretive and recreational costs, as well as general maintenance of SFPUC lands not for source water protection, are allocated to General.

Pumping: Costs associated with <u>treated</u> water pump station infrastructure, pumps, motors, and associated equipment. Costs for raw water pumping facilities are allocated to Source of Supply.

Transmission: Costs associated with large water mains without service connections, including mains that serve wholesale customers.

Treatment: Costs associated with water treatment and production facilities, including intake structures.

Storage: Costs associated with <u>treated</u> water storage facilities, including reservoirs, ground storage tanks, and elevated storage tanks. Costs for raw water reservoirs are allocated to Source of Supply.

Distribution: Costs associated with small water mains with service connections that do not serve wholesale customers.

Meters: Costs associated with water meters and service connections.

Hydrants / **AWSS**: All infrastructure and costs associated solely with providing fire flow.

Customer Billing: All costs associated with producing customer bills, including billing system software, postage, credit card processing fees, etc.

Laboratory: Costs associated with sampling and laboratory analysis of samples. These costs may need to be further allocated between treatment and customer service (distribution system sampling).

Water Conservation: Costs associated with conservation incentive programs and communications aimed at encouraging or mandating customers to reduce water usage.

General: Costs associated with other treatment and administrative services that do not fit any of the other categories. Examples include electrical equipment, HVAC equipment, plant staff vehicles, lands not associated with supply protection or a specific asset, etc.

The SFPUC's budget was analyzed line-by-line. Details of how the O&M, debt service, and other expenditures were distributed among functional categories are shown in Appendix E.

Cost Components and Factors

The water utility's primary cost components are related to three commodity components (base, peak, and raw water), which are the basis of the water commodity rate. The four customer-related costs (customer service, meter charges, public and private fire services) are the basis of the fixed water service and private fire protection charges. Together, these seven elements are referred to as cost categories. In addition to these seven, an AAO category is included for costs that cannot be directly allocated to one or more of the seven cost categories and are therefore reallocated across the cost categories based on the direct allocation of the other line items.

This cost of services analysis eliminated the peak hour factor as a rate component because there was an insignificant difference between the peak hour and peak day factors, per SFPUC staff. Another change made to allocations within this study is the separation of fire protection costs into private and public. While private fire protection costs are only allocated to private fire customers through the private fire service charge, the public fire protection costs are reallocated back to all customer classes based on their fire flow requirements. The changes made to the cost of service allocations since the 2014 study, as well as changes to the operations and capital-related costs, shifted the overall allocation of revenue requirements slightly from base to peak.

The following describes each of the seven cost categories for SFPUC:

Base: Operating and capital costs incurred by the water system to provide a basic level of service to each customer. These costs include baseline supplies, treatment, distribution, and storage, up to a level that meets SFPUC's baseline (average day) demands throughout the year.

Peak: Costs incurred to meet peak day demands for water in excess of base demand. This cost includes capital costs related to oversizing the system to meet excess demand.

The peaking factor is determined by dividing the peak day demand by the average day demand. For the purpose of this study, the average peaking factor for the three year period FY 2014 through FY 2016 of 1.31 was used. This means that for the three-year period, the peak day demand was 31 percent higher than the average day demand. This ratio is used to allocate costs between base and peak.

Private Fire Protection: Capacity-related costs that are incurred based on the incremental, excess capacity that must be designed into the system in order to provide private fire protection service. In

addition, this category includes operating costs associated with inspecting private fire systems.

Customer Service: Expenditures that relate to operational support activities including accounting, billing, customer service, administrative, and technical support. These expenditures are common to all customers and are reasonably uniform across the different customer classes.

Meter Charges: Meter and capacity-related costs, such as meter maintenance charges, are based on the meter's hydraulic capacity.

Raw Water: Costs associated with water supply and the infrastructure needed to transport it in its natural state, prior to any treatment for consumption. Raw water was isolated as a cost category in order to develop the nonpotable water rate.

Public Fire Protection: Costs associated with providing public fire protection services. Similar to private service, the distribution system must have sufficient hydraulic capacity to support the pressures and flow demands for public fire protection service. This also includes costs for the auxiliary water supply system (AWSS).

To account for possible annual fluctuations between cost categories, the forecasted expenditures were averaged over the four-year rate period of FY 2019 through FY 2022. A detailed functional allocation analysis was prepared by separately identifying expenditures (water assets, debt service, and O&M costs), and allocating a portion of costs to each functional component based on the specific function

provided. This allocation is derived from the SFPUC's actual base and peak factors, established on the base-extra capacity method as defined by the AWWA. This methodology separates costs between base costs and extra capacity costs, based on the actual operating history and design criteria of the SFPUC's system, which are used as the basis of the existing rates.

Carollo reviewed the SFPUC's existing water assets and allocated each to the representative function component. Beyond existing assets, each existing debt issue was reviewed and allocated based on the specific use of those funds. Finally, each of the individual operating budget line items was reviewed and its corresponding costs allocated based on the service provided. This functional allocation process provides a reasonable, appropriate basis for proportionately distributing costs to system customers based on their usage patterns and is grounded in cost of service principles and standards. This methodology and process also provides the basis for the tiered rate structure. As such, a larger portion of peak costs are allocated into the outer tier so that they are collected from the customers with higher usage, who are the drivers of peak consumption.

Water Allocations

Water Enterprise Assets

For some debt issues, the information required to allocate the debt service payments based on the projects funded with the proceeds is not available. For these debt issues, we substitute the overall allocation of the water system's fixed assets. First, we allocate the fixed assets' net book values to functional categories based on the various allocation, location, and class codes provided in the fixed asset register. The updated allocation of fixed assets resulted in a shift of the fixed asset capital allocation factors from peak, meter charges, customer service, and fire protection to base. Table 25 summarizes the allocation factors applied to system assets.

| TABLE 25 WATER ENT | ERPRISE ASSET | ALLOCATION | | | | | | | |
|--|---------------|------------|-----------|---------|----------|----------------|---------|-------------|------------|
| | | | | | PERCENT | ALLOCATION (%) |) | | |

| Customer Billing | \$4.0 | | | | 100% | | | | |
| Laboratory | \$1.1 | 100% | | | | | | | |
| General Plant | \$801.9 | | | | | | | | 100% |
| Total Value | \$3,844.3 | \$2,220.2 | \$687.9 | \$0.3 | \$4.0 | \$0.0 | \$119.5 | \$10.5 | \$801.9 |
| Total Percent | 100% | 57.8% | 17.9% | 0.01% | 0.1% | 0.0% | 3.1% | 0.3% | 20.9% |

Notes

- (1) Asset allocation to functional categories is completed in "Fixed Assets Master Classification.xlsx."
- (2) Values represent net book value and are rounded and expressed in millions. Numbers may not add up due to rounding.
- (3) Allocation of categories between base and peak is based on the peaking factor of 1.31 such that 1.00 is allocated to base and the remaining 0.31 is allocated to peak.
- (4) As All Others allocation is reallocated across the other functional components.
- (5) Other source of supply includes groundwater and recycled water and is allocated 100% to peak based on the SFPUC's policy of using these sources to meet peak demand.
- (6) AWSS is the auxiliary water supply system.

These totals include the reallocation of the \$801.9 million AAO value across all other functional categories. AAO is reallocated using the following formula:

$$\frac{As \ All \ Others}{Allocation} = \frac{(AAO \ total \ value \ x \ Component \ value)}{Sum \ of \ all \ component \ values}$$

Table 26 summarizes the total allocated value of assets based on the percentages above in Table 25.

| TABLE 26 WATER ENT | ERPRISE ASSET | TOTAL ALLOC | ATION TOTA | ALS | | | | | |

| Asset Value w/AAO | | \$2,805.3 | \$869.2 | \$0.4 | \$5.1 | \$0.0 | \$151 | \$13.3 | \$0.0 |
| Total Percent | 100% | 73.0% | 22.6% | 0.01% | 0.1% | 0.0% | 3.9% | 0.3% | 0.0% |

Notes:

Water Enterprise Debt Service

Similar to asset allocation, debt service payments are allocated to functional rate components based on the individual capital projects financed by each issuance. Table 27 provides the weighted average of the allocations for each debt issuance. The debt issued for the water system is split between retail and wholesale, with the percentage allocation between the two varying based on the projects funded in each bond series.

The BAWSCA issued revenue bonds to prepay (defease) the remaining capital cost recovery payments that the BAWSCA member agencies owed to the SFPUC as of June 2013. A portion of this prepayment was used to offset retail debt service, and is allocated as all others. Additional BAWSCA offsetting revenue details are in the Water Revenue Requirements chapter.

⁽¹⁾ Values represent net book value and are rounded and expressed in million dollars. Numbers may not add up due to rounding.

⁽²⁾ As All Others allocation is reallocated across the other functional components.

Notes:

- (1) Appendix B provides more details of the value and percentage totals for the Water System debt allocation.
- (2) Values are rounded and expressed in million dollars. Numbers may not add up due to rounding.
- (3) As All Others allocation is reallocated across the other functional components.

Water Enterprise O&M Costs

The Water Enterprise's operating expenses were separated by operating division and, where necessary, further subdivided by type of cost. Carollo worked with SFPUC staff to identify the services provided by each department and the appropriate associated functional categories. The allocations percentages are estimates based on discussions with SFPUC staff. Table 29 summarizes the allocation of the four-year average from FY 2019 through FY 2022 in order to account for changes in expenditures

| TABLE 29 WATER ENTERPRISE | OPERATING | EXPENSES FUN | CTIONAL | ALLOCATIO | DN (FY 2019 — | FY 2022 AVE | RAGE) | | | | | | | | | |

- (2) As All Others allocation is reallocated across the other functional components.

Other Water Enterprise Expenses

In addition to O&M expenses, the Water Enterprise budget includes other expenses, including Programmatic Expenses and Non-Debt Capital Expenses. To obtain an overall percentage allocation, operating expenses, existing and future debt service, other expenses and offsetting revenues are

weighted based on their average annual expenditures over the rate-setting period. Once the overall percentage allocation to functional category has been defined, those percentages are applied to the four-year averaged revenue requirements for FY 2019 through FY 2022 in order to calculate the unit costs, as shown in later in Table 34.

Table 32 summarizes the allocation of these other expenses using the four-year average from FY 2019 through FY 2022 in order to account for changes in expenditures. Programmatic and Non-Debt Capital Expenses are allocated by individual project.

| TABLE 32 WATER ENTERPRISE OTHER EXPENSES ALLOCATION (FY 2019 — FY 2022 AVERAGE) | | | | | | | | | | |
|---|-----------|---------------|---------------|------------------|---------------------|-------------------------|--------------|------------------------|----------------------|--|

Notes

Offsetting Revenue

Wholesale water sales revenue and other non-rate revenue are used to offset the revenue requirements and reduce the required increase in rate revenue. These offsetting revenues are also allocated to the cost components line-by-line. Wholesale sales revenue is allocated based on the allocation used to develop wholesale rates so that wholesale rate revenue truly offsets costs associated with providing wholesale water service. This allocation adjustment is a significant change and improvement over the previous manner of allocating wholesale revenue based on AAO allocation. Similar to the wholesale revenue offset, other revenues that directly fund specific expenses are allocated the same as that expense. For example, programmatic revenue is allocated the same as programmatic expenses.

⁽¹⁾ Values are rounded and expressed in million dollars. Numbers may not add up due to rounding.

⁽²⁾ As All Others allocation will be reallocated across the other functional components based on the total revenue requirements.

Table 33 summarizes the allocation of offsetting revenues using the four-year average from FY 2019 through FY 2022.

Notes:

- (1) Values are rounded and expressed in million dollars. Numbers may not add up due to rounding.
- (2) As All Others allocation will be reallocated across the other functional components based on the total revenue requirements.
- (3) Wholesale operating expenses are allocated as shown in "Wholesale Revenue Allocation.xlsx."
- (4) Wholesale programmatic expenses are allocated based on the wholesale share of the individual programmatic projects.
- (5) Wholesale existing debt service is allocated based on the wholesale share of existing debt.
- (6) Wholesale future capital is allocated based on the wholesale share of the individual future capital projects.
- (7) Federal Bond Interest Subsidy is allocated based on the allocation of the BABs.
- (8) Programmatic revenue is allocated based on the allocation of the individual programmatic projects.
- (9) Non-debt capital revenue is allocated based on the retail share of the individual future capital projects.

Water Enterprise Revenue Requirements Allocation

To obtain an overall percentage allocation, operating expenses, existing and future debt service, other expenses and offsetting revenues are weighted based on their average annual expenditures over the rate-setting period. Once the overall percentage allocation to functional category has been defined, those

percentages are applied to the four-year averaged revenue requirements for FY 2019 through FY 2022 in order to calculate the unit costs, as shown in Table 34.

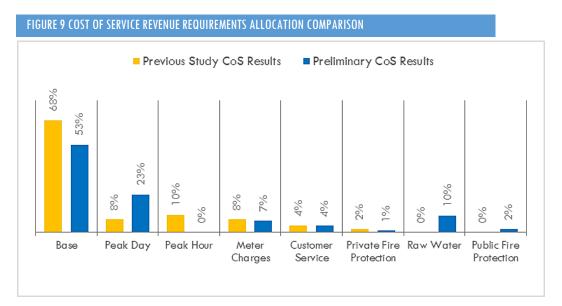

| TABLE 34 WATER ENTERPRISE | TABLE 34 WATER ENTERPRISE ALLOCATION OF REVENUE REQUIREMENTS (FY 2019 — FY 2022 AVERAGE) | | | | | | | | | |
|---------------------------|--|----------------|--------|---------|----------|-------------------|--------|-------------|------------|--|
| | | ALLOCATION (1) | | | | | | | | |
| TOTAL | VALUE | BASE | PEAK | METER | CUSTOMER | PRIVATE FIRE | RAW | PUBLIC FIRE | AS ALL | |
| | | USAGE | USAGE | CHARGES | SERVICE | PROTECTION | WATER | PROTECTION | OTHERS (2) | |
| Operating Expenses | \$256.0 | \$85.6 | \$34.4 | \$17.5 | \$12.5 | \$2.8 | \$55.9 | \$3.0 | \$44.1 | |

| Requirement w/AAO | | \$170.2 | \$73.3 | \$22.9 | \$13.1 | \$3.0 | \$32.2 | \$5.6 | \$0.0 | |
| Total Percent | 100% | 53.1% | 22.9% | 7.2% | 4.1% | 0.9% | 10.0% | 1.8% | 0.0% | |

Notes:

- (1) Values are rounded and expressed in million dollars. Numbers may not add up due to rounding.
- (2) As All Others allocation is reallocated across the other functional components.

The SFPUC has elected to maintain the low fixed-to-variable ratio in order to provide some revenue stability (in the form of fixed charges) while still providing adequate conservation incentives. Although a high fixed charge ratio can lead to greater revenue stability, a low fixed ratio promotes affordability for low volume users and allows users greater control over their monthly bills. Based on the result of the functional allocation, as summarized in Table 34, there is no change in the overall fixed-to-variable ratio (14 percent fixed and 86 percent variable) compared to the existing cost of service study despite the additional functional categories in the current study.

Figure 9 illustrates that, when compared to the results from the 2014 study, the recommended functional allocation costs of the fixed components (meter charges, customer service, and each fire protection) remains at approximately 14 percent. This serves as the foundation for the recommended fixed monthly service charge. As a result, the remaining variable allocation remains at 86 percent and is allocated to the base, peak, and raw water components to serve as the basis for the recommended variable commodity rates.

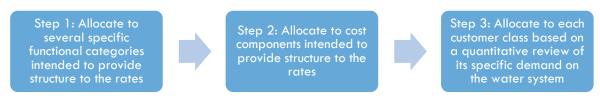

Additionally, the SFPUC does not experience a significant amount of seasonal water demand variability, resulting in stable annual revenues despite recovering most costs through the commodity portion of the rates. We must account for the long-term downward trend that the SFPUC continues to experience within the annual financial forecast.

Carollo worked with SFPUC to ensure that this conservative fixed charge is appropriate for the next four years of rate adjustments. SFPUC does not currently charge a wastewater fixed monthly service charge. This current study's recommended introduction of a wastewater fixed charge while the water system's fixed charge remains at a relatively low percentage maintains a balance between customer affordability and revenue stability. The Wastewater Cost of Service section further details the introduction of the recommended wastewater fixed monthly charge.

FUNCTIONAL ALLOCATION RESULTS

Unit Cost and Customer Allocation

The unit costs of service are developed by dividing the total annual costs allocated to each of the seven cost components by the total annual service units of the respective component. The total annual costs allocated to each cost component are determined by applying the percent allocations summarized in Table 34. Ultimately, the revenue requirement is allocated in three steps:

Following these steps, the revenue requirements for each customer class form a reasonable and cost of service-driven basis for developing rates.

Units of Service

Based on functional category, the units of service are water consumed, meter equivalents, annual bills (based on customer accounts), and fire protection meters.

The following describes the quantifiable analysis of the units of service:

Base Costs: Allocated by total annual sales volume or annual water consumption in ccf.

Peaking Costs: Based on the customer class' peak ratio developed from the ratio between annualized winter consumption and annual consumption. Peak units are based on the extra capacity needed to serve beyond base demand to meet maximum day demand in ccf.

Meter Equivalents: The meter equivalents are derived based on the meter's hydraulic capacity. The total number of meter equivalents is the sum of all customers, excluding private fire.

Customer Service: For the fixed charge, the customer component unit cost is based on the number of accounts.

For the meter capacity charges and fire protection, equivalent meters are used, as opposed to accounts, in order to recognize the fact that larger meters have a higher water flow potential and utilize greater system capacity. The meter maintenance portion of the monthly fixed charge also accounts for meter size, as it is more expensive to install, maintain, and replace larger meters. Meter equivalents are derived based on the hydraulic capacity (gallons per minute) respective to the size of the meter. Meter equivalents are set relative to the hydraulic flow of a 5/8-inch meter.

Unit Cost Development

In order to allocate the cost of service to various user classes, unit costs of service are developed for each cost component. As shown in Table 34, the total rate revenue requirements are allocated to each cost component for the four-year average. The total cost for each functional category is then divided by the total number of associated units of service to determine appropriate unit costs for the Water Enterprise. Table 35 shows the calculation of the unit costs for each cost component, which are then applied to each customer classes' projected use, accounts, and meter equivalents to derive customer class allocations for each year of the rate period.

| TABLE 35 WATER ENTERPRISE UNIT COSTS (FY 2019) | | | | | | | | | |
|--|---------------------|--|-----------------------|--------------------------|-------------------------|---------------------|------------------------|--|--|
| | BASE USAGE (1) | PEAK USAGE (2) | METER CAPACITY CHARGE | CUSTOMER SERVICE | PRIVATE FIRE PROTECTION | RAW WATER | PUBLIC FIRE PROTECTION | | |
| Allocation Percent | 53.1% | 22.9% | 7.2% | 4.1% | 0.9% | 10.0% | 1.8% | | |
| Value Allocable to Component (A) | \$146.2 | \$63.0 | \$19.7 | \$11.3 | \$2.6 | \$27.6 | \$4.8 | | |
| Total Units (B) | 29,574,387 | 14,494,521 | 298,594 | 1 <i>75</i> , 897 | 229,685 | 29,669,585 | 298,594 | | |
| Allocation Basis ⁽³⁾ | Annual Use (ccf) | Annualized Max Day Excess Use (ccf) | Meter Equivalents | Customer Accounts | Hydrant Equivalents | Annual Use (ccf) | Meter Equivalents | | |
| Per Unit Cost = A ÷ B | \$4.95 | \$4.35 | \$5.50 | \$5.34 | \$0.93 | \$0.93 | \$1.35 | | |

Notes:

- (1) Allocable values are rounded to the nearest million. Unit costs are rounded up to the nearest \$0.01.
- (2) The SFPUC peaking factor of 1.31 times the average day demand annualized (or times 365) yields max day excess use.
- (3) Ccf is one hundred cubic feet. 1 ccf = 748 gallons.

Projections are based on current customer usage characteristics and account growth assumptions. As such, costs are allocated to each customer class based on their respective base usage and peaking factors to reflect their proportionate use of the overall system.

Customer Allocation

Carollo worked with the SFPUC to develop appropriate consumption-based customer classes from the SFPUC's customer service and billing system. This data was analyzed to determine the number of accounts by meter size and customer class, as well as the usage characteristics of each customer class. Table 36 details the results of the cost allocation by customer class based on FY 2016 consumption data.

| TABLE 36 WATER SYSTEM UNIT ALLOCATION BY CUSTOMER CLASS (1) | | | | | | | | | | |

Notes:

(1) FY 2016 is the most recent full fiscal year billing data received for water.

Based on available consumption and customer records, Table 37 details the total units of service for each customer class and functional category in accordance with the percentages in Table 36. This customer data is then used to determine appropriate proportional allocation of revenue needs to each customer class.

| TABLE 37 WATER E | NTERPRISE AL | LOCATION OF I | REVENUE REQUII | REMENTS BY CUST | OMER CLASS (F | Y 2019 — FY 202 | 2 AVERAGE) | |

The water rate design analysis determines how the costs are recovered from each customer through specified water rates. The focus of this process is to achieve cost recovery and substantiate that customers are paying their fair and proportionate share of system costs. The SFPUC's existing rate structure consists of two components: a commodity charge (variable) and a monthly service charge (fixed). The commodity component is assessed based on metered water usage per ccf and, by design, is intended to recover the cost incurred for delivering each unit of water. The monthly service charge is intended to recognize that the utility incurs fixed costs to provide the availability of water service, which must be recovered independent of monthly water demands and consumption. These two rate components serve as a basis for the following rate design chapters.

5. WATER RATE DESIGN

Carollo's review and analysis confirms that the SFPUC rates are sound and adhere to industry best practices. In addition to achieving cost recovery and ratepayer equity objectives, the rate analysis presented within this chapter is developed to continue to promote efficient use of water and the City's natural resources.

The purpose of a cost of service analysis was to provide a rational basis for distributing the costs of the SFPUC water and wastewater systems to each customer class in proportion to the demands they place on the system. A detailed cost allocation was developed for both the Water and Wastewater Enterprises based on the unique attributes of each system in order to meet the equity requirements of Proposition 218, the Charter, and SFPUC policy. The Charter requires that the City perform a cost of service study at least every five years so that revenues from rates are adequately funding utility operations, maintenance, and ongoing capital needs, and equitably recover costs from system users. Additionally, in California, water rates must adhere to the cost of service requirements imposed by Proposition 218 of the State Constitution. Proposition 218 requires that property-related fees and charges, including water rates, do not exceed the proportional cost of providing the service.

EXISTING WATER RATE STRUCTURE

The water rate design analysis determines rates required to achieve full cost recovery, proportionately for each customer class. The SFPUC's existing rate structure consists of two components: a commodity charge (variable) and a monthly service charge (fixed). This is a commonly applied rate structure throughout California and nationally. The commodity component is assessed based on metered water usage per ccf and, by design, is intended to recover the cost incurred for delivering each unit of water. The monthly service charge is intended to recognize that the utility incurs fixed costs to provide the availability of water service, which must be recovered independent of monthly water demands and consumption.

The existing water rate structure was reviewed to determine its efficacy in addressing the desired objectives identified throughout the rate study process. As the SFPUC continues to refine its rate structure based on changing demands, legal guidelines, and regulatory changes, Carollo analyzed various rate structure adjustments.

Table 38 and Table 39 summarize the existing approved FY 2018 water rates and charge (effective July 1, 2017) to the various customer classes in order to recover the forecasted revenues needs and achieve the policy objectives of the SFPUC. The monthly service charges are detailed for residential and nonresidential retail customers and private fire service. Retail commodity water rates are detailed for residential customers — single family residential (SFR) and multifamily residential (MFR) — and nonresidential customers.

| TABLE 38 EXISTIN | IG MONTHLY WATER CH | ARGES BY METER SIZE |

| MFR Tier 2 | Over 3 ccf/DU | \$8.81 |
| Nonresidential | | |
| Commercial, Industrial, General Use | All | \$7.64 |
| Interruptible | All | \$6.93 |
| Docks & Ships | All | \$10.10 |
| Builders & Contractors | All | \$9.17 |

Notes

- (1) ccf is one hundred cubic feet. 1 ccf = 748 gallons.
- (2) DU is dwelling unit.

SELECTING RATE STRUCTURES

Once costs have been equitably allocated to each functional component, the SFPUC has some flexibility in designing the rate structure in order to meet its various policy objectives. In determining the appropriate rate level and structure, Carollo analyzed various rate design alternatives and the corresponding customer and utility implications. Beyond the identified study objectives, several additional criteria were considered and discussed at length with SFPUC staff.

PARTIAL LIST OF THE ADDITIONAL ELEMENTS DESIRED IN THE RATE STRUCTURE:

Be clear and understandable

Encourage conservation and water efficiency

Follow cost of service principles

Provide revenue stability

Maintain affordability

Comply with legal and regulatory requirements

Abide by policy objectives

Given the numerous and, at times, competing elements, selection of an appropriate rate structure is complex. There is no single structure that meets all objectives equally, nor are all objectives or elements valued the same by the utility or customers.

Each criteria or element has merit and plays an important role in the rates implementation and overall effectiveness. These elements and competing objectives were discussed and evaluated at length throughout the financial and rate study process.

Monthly Service Charge

Retail Monthly Service Charge

By design, the monthly service charge includes a customer service component and a capacity component based on meter size. The customer service component recovers expenses associated with billing, collection, and customer service. This component is the same for all customers regardless of meter size. The meter capacity component captures maintenance costs related to meters and services, as well as a portion of the

Water Enterprise's capital costs. This component varies based on meter size to reflect the difference in potential demand that can be placed on the system by different sized meters.

Similar to the existing charge, the recommended monthly service charge is a combination of the customer service and meter charges functional components. To determine this charge, the meter charges unit cost presented in Table 40 is multiplied by the appropriate meter capacity ratios, based on maximum flow rates published by the AWWA, to calculate the meter (capacity) charge. These ratios reflect a reasonable cost and benefit factor associated with greater hydraulic flow capacity. Carollo gathered data from the meter group for meter type and size accuracy. Adjustments were made to some meter ratios, i.e. the 3-inch meter and the 10-inch meter, due to these clarifications.

The meter (capacity) charge is then added to the customer service unit cost to calculate the total monthly service charge. The overall percentage increase in the monthly service charge for larger meters is higher than the increase for smaller meters because the customer service and meter charge components do not increase at the same rate. The overall service charge increase is a weighted average of the two components. Since the meter charge increases with meter size while the customer service cost does not, the meter portion becomes an increasingly significant portion of the overall charge as the meter size gets larger, which results in a larger overall increase for larger meters.

The recommended monthly service charge and calculation of components are detailed in Table 40.

| TABLE 40 RECOMME | NDED FY 2019 WATER | MONTHLY SERVICE CHARGE BY M | NETER SIZE | |
|-----------------------|--------------------|-----------------------------|--------------------------------------|---|

| 16 in. | 375.0 | 5.34 | 2,568.75 | 2,574.09 |

Private Fire Protection Monthly Service Charge

Private fire protection service is available for use by the customer, upon election. Although most public or private fire service connections are rarely used, the SFPUC must be ready to provide the necessary water quantities and pressures at all times throughout the distribution system. Utilities generally provide public fire protection through hydrants owned by that agency. Further, utilities typically provide individual customers additional fire protection through private hydrants, standpipes, or sprinkler connections. Although private fire protection connections do not use water except in case of fire, they do consume available capacity within the system. In addition to the adjustments to the potable retail rate structure, Carollo analyzed the costs associated with providing private fire protection service. Following the cost of service principles, this analysis isolated costs related to providing system capacity to store and deliver water for fire suppression to privately-owned and operated fire sprinkler systems.

The private fire protection charge is designed to recover a proportionate share of system costs for non-public fire system requirements and excludes any costs of the AWSS that are funded through non-rate

revenue such as property taxes or general obligation (GO) bond proceeds. In addition to funding fire system costs, the monthly fire protection rates include a customer service component, which is charged to each water utility bill regardless of service type. Table 41 shows the calculation of the monthly service charge for private fire protection customers.

| TABLE 41 RECOMMEN | NDED FY 2019 WATER A | MONTHLY PRIVATE FIRE SERVICE | CHARGE BY METER SIZE | |
|-----------------------|----------------------|------------------------------|--------------------------------------|---|
| METER SIZE | METER RATIO | CUSTOMER SERVICE COST | METER CHARGE (METER SIZE X RATIO) | MONTHLY SERVICE CHARGE (METER + CUSTOMER SERVICE) |
| 1 in. | 2.5 | \$5.34 | \$2.33 | \$7.67 |
| $1 - \frac{1}{2}$ in. | 5.0 | 5.34 | 4.65 | 9.99 |

| 12 in. | 215.0 | 5.34 | 199.95 | 205.29 |

COMMODITY RATES

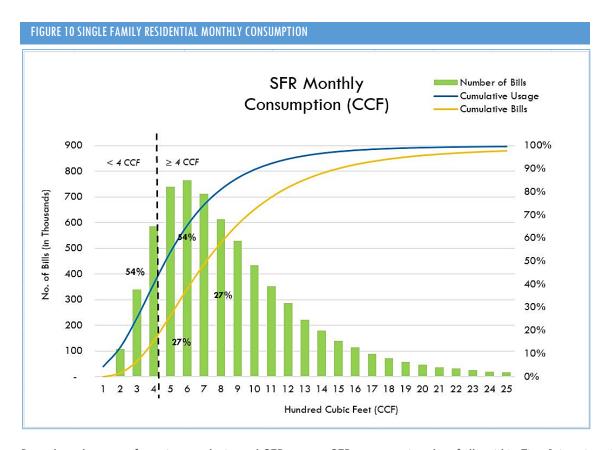

In addition to the monthly service charge, residential customers pay a commodity rate per unit of water consumed. Carollo worked with SFPUC staff to discuss, review, and analyze various recommended commodity rate structures. Based on these discussions, Carollo recommends the SFPUC retain its existing water rate structure for residential customers. Existing residential commodity rates are designed to encourage water conservation and are charged on an inclining block rate schedule.

The existing tier structure is determined based on the SFPUC's residential monthly use pattern over the course of a year. The existing residential tiers were derived by evaluating all residential water usage throughout the retail water system. For SFR customers, usage above 4 ccf per month is charged a higher per unit charge to reflect the added cost to supply peak water demands. The charge assessed to MFR customers is similar but for usage above 3 ccf per month per dwelling unit. All monthly water usage occurring in the first tier is charged at the first tier commodity rate of \$6.42 per ccf for SFR and \$6.57 per ccf for MFR. For each unit in the second tier, SFR and MFR customers are charged at a rate of \$8.62 and \$8.81, respectively. In order to proportionally meet the cost of service requirements, the tiered rates for SFR and MFR individually must reflect the demand placed on the system and the cost to serve those customers.

Because water consumption patterns differ between SFR and MFR within the retail area, Carollo evaluated each class separately to determine the appropriate tier break (usage allowance) at which to transition from Tier 1 to Tier 2.

Single Family Residential

Figure 10 provides a detailed histogram of monthly SFR usage based on an average year. The vertical bars represent the number of monthly bills at each unit of consumption. Based on the detailed consumption analysis, Carollo does not recommend changing the tier break for SFR customers. The first tier (0-4 ccf per month) encompasses 27 percent of SFR bills and 54 percent of SFR customers' annual water demands as indicated by Figure 10.

Based on the cost of service analysis and SFR usage, SFR consumption that falls within Tier 1 is primarily non-peak water usage and is used consistently throughout the course of the year. The Tier 1 rate is set to recover the cost of non-peak water delivery and a minimal share of peak costs, accounting for the peak demand that does occur under 4 ccf. Tier 2 then accounts for the majority of costs associated with peaking not accounted for in Tier 1. As such, the existing break point between Tier 1 and Tier 2 is appropriate to distinguish between typical base demand customers and peaking customers.

Base costs are allocated to the two tiers based on the projected demand in each tier, as shown in the equation below. Peak costs are allocated between the two tiers based on the minimum month ratio (Tier 1) and the maximum month ratio (Tier 2), applied to the appropriate tier demand over the sum of the weighted tier demands, as shown in the second equation below. In addition, water conservation costs are included in the Tier 2 rate to reflect the effort to reduce the water consumption of high-volume users. Table 42 details the method for calculating rates for SFR users.

$$\textit{Base Cost Allocation} = \textit{Total Base Cost} * \frac{\textit{Tier Demand}}{\textit{Total Demand}}$$

$$\textit{Peak Cost Allocation} = \textit{Total Peak Cost} * \textit{Peak Ratio}_n * \frac{\textit{Tier Demand}_n}{\sum_{n=1}^2 (\textit{Tier Demand}_n * \textit{Peak Ratio}_n)}$$

| TABLE 42 SINGLE FAMILY RESIDENTIAL FY 2019 WATER COMMODITY RATE CALCULATION | | | | |
|---|--------------|--------------|--------------|--|
| | TIER 1 | TIER 2 | TOTAL | |
| Base Costs (A) | \$26,379,555 | \$15,609,627 | \$41,989,182 | |
| Peak Ratio (minimum/maximum month) | 0.91 | 1.13 | | |
| Peak Costs (B) | \$7,298,313 | \$5,362,714 | \$12,661,027 | |
| Conservation Costs (C) | \$0 | \$1,243,332 | \$1,243,332 | |
| Projected Consumption (ccf) (D) | 4,457,229 | 2,637,485 | 7,094,714 | |
| SFR Unit Cost (\$/ccf) | \$7.56 | \$8.43 | | |
| $= (A + B + C) \div D$ | \$7.30 | \$0.43 | | |

Multifamily Residential

A similar analysis was completed for MFR customers. A detailed histogram of MFR usage is shown in Figure 11. Based on this analysis, the existing tier break at 3 ccf is appropriate for MFR customers because it captures most of the base consumption with most of the peak consumption included in the second tier. Carollo does not recommend any adjustments to the tier break for MFR customers. Similar to SFR customers, MFR consumption that falls within Tier 1 would be charged at the base unit cost or commodity rate, which is set to recover the base (non-peak) costs and accounts for a small portion of costs related to peaking or extra capacity.

Based on the tier break of 3 ccf, some peaking occurs within Tier 1, which is then reflected in the Tier 1 rate. Tier 2 would account for the majority of system peaking and, accordingly, is allocated the majority of peaking costs in the recommended rate structure according to the formula previously shown. In addition, water conservation costs are included in the Tier 2 rate to reflect the effort to reduce the water consumption of high-volume users.

The first tier (0-3 ccf per month) encompasses 39 percent of SFR bills and 65 percent of MFR customers' annual water demands as indicated by Figure 11.

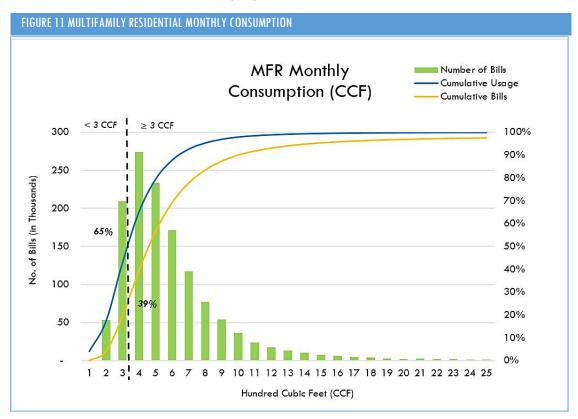

Table 43 details the method for calculating rates for MFR users.

| TABLE 43 MULTIFAMILY RESIDENTIAL FY 2019 WATER COMMODITY RATE CALCULATION | | | | | |
|---|--------------|--------------|--------------|--|--|
| | TIER 1 | TIER 2 | TOTAL | | |
| Base Costs (A) | \$45,661,696 | \$18,240,999 | \$63,902,695 | | |
| Peak Ratio (minimum/maximum month) | 0.94 | 1.11 | | | |
| Peak Costs (B) | \$12,660,506 | \$5,972,317 | \$18,632,823 | | |
| Conservation Costs (C) | \$0 | \$1,829,771 | \$1,829,771 | | |
| Projected Consumption (ccf) (D) | 7,717,070 | 3,082,827 | 10,799,896 | | |
| MFR Unit Cost (\$/ccf) = (A + B + C) ÷ D | \$7.56 | \$8.45 | | | |

Nonresidential

Existing commercial, industrial, and general use customers pay a uniform commodity rate of \$7.64 per ccf. Existing irrigation customers also pay a uniform rate of \$7.64 per ccf. Existing docks and ships customers pay a uniform rate of \$10.10 per ccf, and existing builder and contractor customers pay a uniform rate of \$9.17 per ccf. Unlike residential customers whose use is relatively homogeneous, nonresidential users are diverse and vary significantly in size and usage, even between similar businesses. As the SFPUC continues to gain additional data through its Automated Metering Infrastructure (AMI) system, it is able to better identify unique customer demand patterns and costs which allows the creation of more specific rate subclasses within the nonresidential class. The AMI system automatically collects frequent data to accurately monitor water consumption and detect leaks faster than conventional, manually-read water meters.

Carollo recommends a single nonresidential rate that retains the existing uniform commodity rate structure. However, according to the updated cost of service analysis, we recommend that the FY 2019 rate be increased to \$8.33 per ccf. The methodology for calculating the nonresidential rate is shown in Table 44.

| TABLE 44 NONRESIDENTIAL FY 2019 WATER COMMOI | DITY RATE CALCULATION |
|--|-----------------------|
| | ALL |
| Base Costs (A) | \$67,828,556 |
| Peak Costs (B) | \$28,609,412 |
| Consumption (ccf) (C) | 11,592,776 |
| Unit Cost ($\$/ccf$) = (A + B) ÷ C | \$8.33 |

Interruptible Rate

The SFPUC has an existing rate of \$6.93 per ccf for occasions when maximum water demands consistently approach the limitations of supply or treatment capacity, or when peak load growth projections show a rapid increase in peak demands on the system. This rate, known as an interruptible rate, covered costs to provide interruptible service to some large customers. Although this provided benefits to customers by keeping rates low, Carollo recommends eliminating this rate and charging existing interruptible customers the nonresidential rate as calculated in Table 46. Ultimately, the interruptible users must pay both their share of operational costs and capital costs. A demand analysis confirmed the existing assumption that all irrigation users used this rate, and further proved that irrigation consumption was its largest use. Based on this analysis, Carollo recommends that the interruptible rate be replaced with the nonresidential rate for FY 2019.

Nonpotable Rate

Nonpotable (raw) water is available to customers inside and outside the City and County of San Francisco in its natural state prior to any treatment. Rates recover the costs associated with the infrastructure and supply of untreated water service when the customer furnishes all facilities necessary to convey the

untreated water from the system's supply reservoirs to the customer's point of use. Table 45 shows the calculation of the nonpotable water rate. The most notable driver for the reduction of the non-potable water rate is this study's detailed allocation of wholesale revenue offset, which reduced the retail portion of raw water costs substantially.

| TABLE 45 NONPOTABLE FY 2019 WATER COMMODITY RATE CALCULATION | | | | |
|--|----------|--|--|--|
| | ALL | | | |
| Base Costs (A) | \$69,635 | | | |
| Consumption (ccf) (B) | 94,722 | | | |
| Unit Cost (\$/ccf) = A ÷ B | \$0.75 | | | |

RECOMMENDED SFPUC RATES

In an effort to reduce rate shock as a result of adjustments to the peaking factors used to determine the differential between the tiers, Carollo recommends transitioning the residential commodity rates from the existing rates to the cost of service rates calculated for FY 2022 over the next four-year period. For this reason, some of the recommended rates for FY 2019 differ from the calculated rates shown previously in this section. The recommended rates for FY 2019 through FY 2022, including phasing in the differences between tiers, are summarized below in Table 46 and Table 47. Throughout the rate-setting process, Carollo worked closely with SFPUC staff to evaluate the impact of the recommended rate structure to water customers.

Proposed Service Charges

Similar to the existing charge, the recommended monthly service charge is a combination of the customer service and meter charges functional components. Table 46 summarizes the annual increase in the monthly service charge during the four-year study period.

| TABLE 46 RECOMMENDED WATER MONTHLY SERVICE CHARGES BY METER SIZE (1) | | | | | | |
|--|-------------|----------|----------|----------|----------|--|
| | CURRENT | PROPOSED | | | | |
| METER SIZE | FY 2018 (2) | FY 2019 | FY 2020 | FY 2021 | FY 2022 | |
| 5/8 in. | \$11.63 | \$12.19 | \$13.15 | \$14.06 | \$15.04 | |

Notes:

CUSTOMER IMPACTS

Figure 12 illustrates the impact of the recommended water rates to SFR customers with a 5/8-inch meter across various usage levels.

⁽¹⁾ Charge is rounded up to the nearest \$0.01.

⁽²⁾ FY 2018 already has an approved rate increase.

Figure 13 illustrates the impact of these recommended water rates to MFR customers with a 5/8-inch meter across various usage levels.

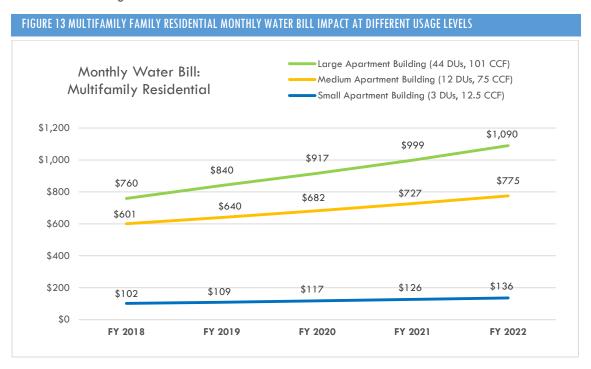

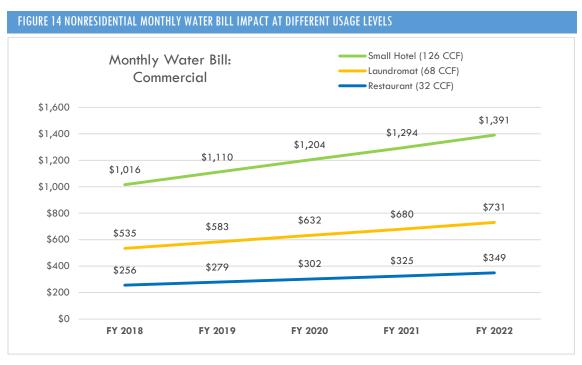

Figure 14 illustrates the impact of these recommended water rates to nonresidential customers with a 5/8-inch meter across various usage levels and business types.

DROUGHT SURCHARGE

To enhance revenue stability for water operations, Carollo recommends that SFPUC implement surcharges to retail water rates to be applied during periods of reduced water demand associated with drought conditions. As discussed in the Water Cost of Service chapter, 86 percent of SFPUC's revenues are variable in that they fluctuate with changes in water demands. A drought surcharge allow the SFPUC to react to revenue shortfalls driven by sustained decreases in sales due to drought, supply limitations, or other circumstances, and would only be assessed if the SFPUC declares water supply shortages while continuing to incentivize conservation.

For residential customers, recommended surcharges are based on the assumption that an overall demand reduction is split evenly between Tier 1 and Tier 2 and that the recommended surcharge is applied to all rates. Each nonresidential customer would incur the recommended percent drought surcharge uniformly. The overall required surcharge is based on the final formula:

$$Surcharge (\$perccf) = \frac{Water\ Revenue\ Shortfall\ from\ reduced\ demand}{Reduced\ demand}$$

The proposed drought surcharge aims to give SFPUC the flexibility to adapt to changes in usage, revenues, and costs.

6. WASTEWATER ENTERPRISE REVENUE REQUIREMENTS

Carollo conducted a revenue requirements analysis to determine the annual system revenue necessary to be recovered through wastewater rates and charges in order to meet the Wastewater Enterprise's expected financial obligations. The revenue requirement analysis covers the study period FY 2018 through FY 2028. The primary focus for rate setting was given to the four years, FY 2019 through FY 2022, since the SFPUC already has an approved rate increase of 11 percent for FY 2018. Based on the findings of this study, Carollo recommends the Wastewater Enterprise increase rate revenues by an average of 9 percent per year over the four years, FY 2019 through FY 2022, in order to fund operations and capital needs, and meet debt service obligations associated with the SSIP and other infrastructure priorities. The proposed findings support the Wastewater Enterprise's ability to continue meeting its level of service objectives.

REVENUE REQUIREMENTS OVERVIEW

The revenue requirement analysis compares the forecasted revenues of the utility to its forecasted operating and capital costs to determine the adequacy of the existing rates to recover the utility's costs of providing service. Should any deficits be identified, additional funding is reviewed and recommended based on strategic goals and available funding. Through its annual budgeting process, the SFPUC performs a detailed review of its costs, including operations and maintenance expenditures, annual debt service, capital expenditures, policy requirements, and reserve requirements.

Carollo examined the SFPUC's FY 2019 budget expenses as the base year for O&M costs and worked with the SFPUC to forecast total expenses. Carollo also collected information related to current reserve fund balances, budgeted CIP expenses, other expenses, revenues, and miscellaneous financial information. Once the revenue requirement is established by compiling all of the SFPUC's cost drivers, two tests are utilized to determine whether the annual revenues are sufficient: a cash flow test and a debt coverage test. Should both tests "fail," the test with the larger deficiency is determined to be the primary driver. Based on the results of the baseline revenue requirement analysis, the main driver in the first few years is the debt coverage requirement, and in later years cash flow drives the need for additional revenue.

Cash Flow Test

The cash flow sufficiency test evaluates whether revenues exceed expenses for a net positive cash flow at the end of each fiscal year. When they do not, this test is not passed, and additional rate revenue is recommended. The cash flow test identifies the amount of annual revenues that must be generated in order to meet annual expenditure obligations. These obligations include O&M expenses, debt service payments, policy-driven minimum reserve, and rate-funded capital expenses. These expenses, less offsetting revenues from other sources, are compared to total annual projected retail rate revenues. Deficits are then used to estimate the need for rate revenue increases. The analysis also considers existing reserves and financial policies to help mitigate or smooth the need for rate adjustments in the short-term. Within the SFPUC's Fund Balance Reserve Policy, it is stated that excess reserve amounts will be considered for contingencies and rate stabilization. As such, the SFPUC has the ability to use unrestricted reserves, if available, to satisfy the annual cash flow test in order to minimize rate spikes.

Debt Coverage Test

Many agencies use bonded indebtedness to fund a portion of their capital expenses. The debt service coverage test measures the ability of a utility to meet both legal and policy-driven revenue obligations associated with debt. Debt service coverage is dictated by each agency's bond covenants and establishes an amount that a borrower must raise in revenue in excess of operations and debt-related expenses. Debt issuance is a significant funding source for the SFPUC's capital programs.

Under the SFPUC wastewater indenture, revenues pledged to cover debt service must meet two separate ratios: (1) current and (2) indenture.

1. Current coverage requires annual revenues to meet a minimum of 1.00x (times) the annual debt service. This measure looks at only current year revenues and may exclude certain revenues and expenditures, depending on the covenant.

$$\frac{\textit{Current}}{\textit{Coverage}} = \frac{(\textit{Annual Revenues} - \textit{Operating Expenses})}{\textit{Annual Debt Service}}$$

2. By indenture, the SFPUC is required to collect sufficient net revenues to meet or exceed 1.25x the annual debt service. This measure includes current year revenues plus the unappropriated fund balance for debt service coverage sufficiency.

$$\frac{\textit{Indenture}}{\textit{Coverage}} = \frac{(\textit{Annual Revenues} - \textit{Operating Expenses}) + \textit{Unappropriated Fund Balance}}{\textit{Annual Debt Service}}$$

However, to ensure that the SFPUC retains financial flexibility for contingencies, the Commission has adopted and implemented a debt service coverage policy that targets higher metrics than the minimum debt service coverage requirements. The SFPUC has adopted a current coverage ratio of 1.10x and indenture coverage ratio of 1.35x. This means that the SFPUC must raise enough revenue to cover all operations and maintenance expenses, including debt service, plus an additional 10 basis points. Similarly, the indenture coverage ratio requirement is an additional 10 basis points.

ANALYSIS ASSUMPTIONS AND INPUTS

Wastewater Enterprise Baseline Inputs

As of FY 2016, the SFPUC is responsible for providing wastewater collection and treatment service to over 163,000 residential, commercial, industrial, and institutional customers. Table 48 summarizes the SFPUC's accounts and billable wastewater flow by customer class. The billable flow includes both dry weather (sanitary) and wet weather (rain) flows. These customer accounts and billable flow volumes are used as the basis for projected customer use within this study.

| TABLE 48 WASTEWATER ENTERPRISE FY 2016 PROFILE | | | | |
|--|-----------------------|----------------------|--|--|
| CUSTOMER CLASS | NUMBER OF ACCOUNTS | BILLABLE FLOW (1) | | |
| SFR | 111,072 | 5,995,178 | | |
| MFR | 36,171 | 9,794,389 | | |
| Nonresidential | 16,075 | 7,885,080 | | |
| Total | 163,319 | 23,674,647 | | |
| Notes: (1) Measured in billi | | | | |

Forecast Assumptions

The SFPUC's FY 2019 operating budget served as the basis for forecasting future operating expenses for the Wastewater Enterprise. The budget was compared to the current internal financial forecast and discussed with SFPUC staff to identify expenses that may need to be adjusted or are not appropriate to include when projecting into future years. This includes any incremental costs due to the SSIP. The escalation factors used in this analysis are based on input from the SFPUC staff and a review of both the long-term and recent cost escalation from the Engineering News-Record (ENR) Index, an industry benchmarking resource. The escalation factors are presented Table 49.

| TABLE 49 WASTEWATER ENTERPRISE ESCALATION FACTORS | | | | |
|---|---|-----------------|--|--|
| ESCALATION FACTOR | DESCRIPTION | ESCALATION RATE | | |
| General Cost Inflation 3% | Long-range O&M cost growth. | 3.0% | | |
| Account Growth | Number of accounts will increase by this factor. | 0.1% | | |
| Retail Rate Increase | Increase in wastewater rate due to changes in revenue requirements. | Varies | | |
| SSIP Capital Inflation | Increase in costs related to the SSIP. | Varies | | |
| Total Expenses Increase | Increase in all operating and non-operating expenses costs. | Varies | | |

The SFPUC individual line item costs were each assigned one of the escalation factors shown in Table 49 to account for variability among cost categories. These escalation factors were then applied to the appropriate categories of expenses to forecast costs incurred by the Wastewater Enterprise.

Forecasting Wastewater Enterprise Expenses

Operating expenses are costs that the utility incurs for daily operations, such as personnel salaries and benefits, system maintenance, fuel, and chemicals. As part of the budget process, an O&M forecast is developed for the Wastewater Enterprise. The operating budget expenditures include costs related to administration, maintenance, operations, environmental engineering, planning and regulations, collection systems, wastewater labs, and other miscellaneous expenses. These expenditures can be summarized in the following main categories listed below:

- 1. Administration: Covers non-allocated administrative costs that support the strategic goals and operations of the combined sewer system.
- 2. Collection: The SFPUC service area relies on an extensive network of pipelines and lift stations to convey wastewater to treatment facilities.
- 3. O&M: Costs in this category support ongoing operations, maintenance, and repair.
- 4. Treatment: Chemicals and other direct supply costs for treatment of conveyed wastewater.
- 5. Energy: Sewer collection, treatment, and disposal are energy-intensive processes. As a result, the SFPUC incurs significant energy expenses in order to operate its treatment facilities.

In future years, additional incremental O&M costs associated with capital assets from the SSIP are expected. These will be in addition to the escalated O&M costs discussed above. For FY 2019, the total O&M cost of the Wastewater Enterprise, including Programmatic Expenses, is budgeted at \$176.7 million. Costs for FY 2020 through FY 2028 were estimated using the FY 2019 budget and applying the appropriate annual escalation factors.

Table 50 presents a summary of the Wastewater Enterprise's operating expenses.

Wastewater Discharge Characteristics

The Wastewater Enterprise maintains the 900-mile long combined sewer system and 17 pump stations that collect sewage and stormwater, moving the wastewater to the three treatment plants for treatment and discharge to the San Francisco Bay and Pacific Ocean. On a non-rainy day an average of 80 million gallons of wastewater is collected and transported to one of the two dry-weather treatment plants: the Southeast Treatment Plant or the Oceanside Treatment Plant. During a storm, the North Point Wet Weather Facility is activated to treat additional flow. Overall, the sewer system can collect and treat over 500 MGD when it rains. In addition to flows, wastewater facility operations involve strength-related treatment for COD; TSS; and FOG.

Projected annual wastewater discharge characteristics for the FY 2018 through FY 2028 study period are based on the FY 2016 consumption data as shown in Table 51. The total flow volume equals the billable flow in Table 48, separated into dry weather flow and wet weather flow (23.1 percent of total flow) based on precipitation patterns and North Point Wet Weather Facility activation for the period FY 2013 through FY 20171.

| TABLE 51 WASTEWATE | R DISCHARGE VOLUME FY | 2016 | | | |
|--------------------|-----------------------|-------------|-------------|------------|------------|
| CUSTOMER | WET WEATHER(1) | DRY WEATHER | COD (2) | TSS (3) | FOG (4) |
| CLASS | (FLOW) | (FLOW) | (LBS) | (LBS) | (LBS) |
| SFR | 1,384,886 | 4,610,292 | 25,599,859 | 10,442,047 | 3,181,269 |
| MFR | 2,262,504 | 7,531,885 | 41,822,776 | 17,059,289 | 5,197,275 |
| Nonresidential | 1,821,453 | 6,063,627 | 36,758,773 | 12,207,135 | 4,551,904 |
| Total | 5,468,843 | 18,205,804 | 104,181,408 | 39,708,471 | 12,930,448 |

- (1) Flow measurements are in ccf. (2) COD is the chemical oxygen demand.
- (3) TSS is the total suspended solids.
- (4) FOG is fats, oils, and grease.

¹ FY 2014 is excluded because the data was unavailable.

Capital Improvement Program

Charter Section 8B.123 requires the SFPUC Financial Services staff to develop a Long-Term Capital Improvement Program ("10-Year Capital Plan" or "Capital Plan") and a Long-Range Financial Plan ("10-Year Financial Plan" or "Financial Plan"). In addition, Charter Section 8B.123 requires that the Commission hold public hearings on an annual basis to review, update, and adopt the Capital Plan and the Financial Plan. The Capital Plan contains a list of projects to be executed during the planning horizon, including cost estimates and schedules. The Financial Plan contains estimates of operations and maintenance expenses, repair and replacement costs, debt costs, and rate increases. Together, these two plans serve as a basis and supporting documentation for the Commission's capital budget and issuance of revenue bonds and other indebtedness.

The SSIP is a 20-year citywide investment to upgrade and replace vital sewer infrastructure. Annual capital expenditures will increase substantially in upcoming years due to the 20-year SSIP. The SSIP is divided into three overlapping phases. In 2012, the Phase 1 Capital Budget was approved for a total of \$2.91 billion and is 21.1 percent complete as of the end of FY 2017. The expected completion for SSIP Phase 1 is October 2026. All three phases are expected to total nearly \$7 billion, funded through a combination of new debt issuances and cash sources including operating revenues, capacity charges, and other sources.

Some of the non-SSIP capital expenses include repair and replacement of the collection system, treatment plant improvements, condition assessments, and capital services to other City departments. In the 10-year CIP, capital needs from FY 2018 through FY 2028 were identified, and the summary of the estimated CIP during the study period is provided in Table 52.

| | FY | FY | FY | FY | FY | FY | FY | FY | FY | FY | FY |

(1) Values are in million dollars and rounded. Values may not add up due to rounding.

In addition to annual payments for existing debt, the SFPUC anticipates issuing additional bonds to finance SSIP projects, as well as a portion of repair and replacement projects. Projected annual payments for new debt issuances were calculated assuming a loan term of 30 years with an annual interest rate of 5 percent and 30 months of capitalized interest. Because the SFPUC uses 30 months of capitalized interest, debt service payments begin three years following the date of issuance. This delays the impact to annual rate revenue requirements, until an asset is placed in service. This use of long-term debt is a reasonable approach as it also allows the SFPUC to align the capital expenses with the ratepayers benefitting from the projects by having both existing and future customers pay for these improvements.

Policy Requirements and Debt Coverage

Policy and Legal Compliance

At the beginning of FY 2018, the SFPUC's available reserves totaled approximately \$144.7 million. Per SFPUC policy, the amount held in these reserves must be equal to or exceed 25 percent of operating expenses. The SFPUC currently exceeds this policy requirement and has accordingly planned to cash fund a portion of future capital projects using available reserves.

Based on existing debt covenants, the SFPUC is required to maintain a coverage ratio of at least 1.00x based on current revenues and 1.25x based on current year revenues and indentured reserves. As detailed previously, this coverage is calculated as the ratio of net revenues available after O&M and debt service, including current or indentured reserves, respectively, to total annual debt service requirements. Per SFPUC debt service coverage policy, a current coverage target of 1.10x has been defined to allow greater flexibility and allowance for future debt issues. An indenture coverage target at least 1.35x net revenues for operating expenses, including reserves, to total annual debt service requirements must be maintained. The actual coverage ratios are expected to be 3.04x (current) and 5.90x (indenture) for FY 2018.

Debt Service

The SFPUC finances major capital improvements, in part, by issuing debt for two primary reasons. First, given the size of the capital program, the SFPUC does not have the available financial reserves or annual revenues necessary to fund a CIP, nor would it be reasonable to increase the wastewater rates and charges in order to cash fund these improvements. Second, spreading the debt service costs for long-lasting projects over the repayment period provides intergenerational equity by effectively spreading the financial burden among existing and future users of the system. This approach allows the SFPUC to better match the cost of improvements with the customers benefitting from the improvements.

The SFPUC has existing debt obligations from past capital projects that were debt financed. The annual payments for existing debt are calculated on a fiscal year basis and were provided by the SFPUC. The recently adopted Capital Financing Policy requires 15-30 percent of CIP to be funded with rate revenue (non-debt capital). As noted earlier, the SFPUC will be required to revisit this forecast if revenues do not materialize as projected. It is important that the SFPUC maintain a 1.10x (current) and 1.35x (indenture) coverage ratio of annual debt service per its policy. If SFPUC revenues are insufficient to meet its debt coverage requirement of 1.00x (current) and 1.25x (indenture), its credit rating could be downgraded, which could have significant interest rate cost impacts due to the amount of debt expected to be issued in upcoming years.

REVENUE REQUIREMENTS

Pre-Rate Increase Revenue Requirements

Based on the study projections, current revenues will not be sufficient in future years to fund necessary expenses due to the aforementioned increases in annual capital expenditures. In the absence of any annual rate increases, revenues are not anticipated to increase. Although additional customers are expected to connect to the system, consumption and thus the number of discharge units from associated customers is projected to decrease by 0.5 percent annually. As discussed earlier in this chapter, the SFPUC must meet both the cash flow test and bond coverage test for any given year in order to achieve adequate collection of revenues. Retail rate revenue increases are required to meet funding obligations of the utility.

Although the recommended rate increases result in excess cash flow within the four-year rate-setting time frame, beyond this period, expenditures are projected to increase with annual debt service payments

related to funding of the SSIP and other capital projects. These investments and associated debt service, along with inflationary operational costs, result in annual increases in revenue needs in future years.

Wholesale and Offsetting Revenue

Beyond volumetric rates and charges, the SFPUC collects revenues through other funding sources, such as capacity charges, interest earnings, lease revenues, and revenues from wholesale customers. These offsetting revenues reduce the total rate revenue that must be collected from retail customers. Table 53 shows the revenue requirement for the Wastewater Enterprise without a rate increase.

As illustrated, the current retail rates are not sufficient to fully fund all annual cash needs of the utility over the next ten years. Before considering rate smoothing, increases are generally calculated using the test (cash or debt) with the greatest deficiency.

⁽¹⁾ Values are in million dollars and rounded. Values may not add up due to rounding.

⁽²⁾ Wholesale sales reflect previously adopted wholesale rate increases.

⁽³⁾ Operating Expenses includes Programmatic Expenses.

Revenue Requirements with Rate Increase

Carollo recommends annual rate increases with the resulting cash flow and operating reserve fund balances represented in Table 54 for the Wastewater Enterprise. The recommended rate revenue increases average 9 percent per year over the four years, FY 2019 through FY 2022, and are aimed at ensuring that the SFPUC collects sufficient funds to pay operational and capital expenses, including debt service obligations. The Wastewater Enterprise fund balance is above minimum policy levels during this period to help manage risks associated with the complex, multi-billion dollar SSIP program.

Notes:

The recommended revenue increases shown in Table 54 were determined using industry-accepted best practices and methodologies. SFPUC staff worked closely with Carollo to review all data, assumptions, and calculations that resulted in the recommendations outlined in this report. Carollo further recommends that the SFPUC review and update the financial plan and revenue requirements annually to recognize changes in customer billing data, operating expenditures, changing wastewater flows and loadings, and capital improvement needs..

⁽¹⁾ Values are in million dollars and rounded. Values may not add up due to rounding.

⁽²⁾ Prior to this study, the SFPUC approved an 11% rate increase for FY 2018.

⁽³⁾ Wholesale sales reflect previously adopted wholesale rate increases.

7. WASTEWATER COST OF SERVICE ANALYSIS

The cost of service analysis serves as a rational basis for distributing the full costs of SFPUC's services to each customer class in proportion to the demands placed on the system. Carollo developed a detailed cost allocation that serves as the basis for the proposed rate adjustments. The allocation developed through this study provides a stable method for allocating costs within the wastewater system.

The cost of service analysis employs a tailored review of costs with a step-by-step approach. Based on the revenue requirement analysis outlined in its respective chapters, the functional allocation designates each budget item to an SFPUC functional category, which is intended to translate each cost into a specific rate component.

Those functional categories and their associated costs are allocated to the distinct customer classes based on each class' unique flow and strength demands. A customer class consists of users that commonly create or share responsibility for certain costs incurred by the utility. Carollo determined the appropriate SFPUC customer classes based upon their discharge characteristics, which are measured through a meter (flow), estimated based on water consumption (flow when there is no

Revenue Requirement

SFPUC's budget and funding goals outline the needed rate revenue.

Functional Allocation

The revenue requirement is assigned to functional categories on a line-by-line basis.

Cost Component Allocation

The functional categories are assigned to cost components based on engineering standards.

Customer Class Allocation

The cost components are reallocated to each class based on demand profiles.

Rate Design

The results of the customer class allocation form the basis of the rate design.

wastewater meter), sampled (loadings), or assumed based on typical characteristics of similar residence or business types (loadings where sampling data is unavailable).

The rate design process establishes a rate structure that proportionately recovers costs from customer classes and customers within each customer class. The final rate structure and rate recommendations are designed to (1) fund the utility's projected costs of providing service, (2) proportionally allocate costs to system customers, and (3) provide a reasonable balance of revenue stability. The rate design will be further detailed in the next chapter of this study.

FUNCTIONAL COST ALLOCATION

Functional Cost Categories

The SFPUC applies separate allocations for O&M and capital costs in order to more accurately reflect appropriate cost relationships. This process allows the SFPUC to recover a proportionate share of annual costs related from each customer through the user rate based on their individual flow and loading discharges, as well as more general expenses that apply to all customers.

The functional components used for the SFPUC were:

Influent Pumping/Headworks: Costs associated with pumps used to move the wastewater from an influent wet well to the headworks facility.

Primary Clarifiers: Costs associated with the initial treatment of wastewater to reduce the content of suspended solids and their embedded pollutants.

Secondary Treatment: Costs associated with treating wastewater to achieve a certain degree of effluent quality with physical separation processes and biological processes to remove organic compounds.

Chlorination/Dechlorination: Costs associated with the introduction of chlorine as a disinfectant and its subsequent removal.

Solids Thickening: Costs associated with increasing the solids concentration and reducing free water content.

Biosolids Thickening: Costs associated with condensing Biosolids to produce a concentrated supernatant. Thickening overall helps reduce the volume of residuals and improves transfer, storage, disposal, etc.

Effluent Discharge: Costs associated with managing and controlling treated wastewater outflow.

Tertiary Treatment: Costs associated with the final treatment process before treated wastewater is reused, recycled, or discharged into the environment.

Pump/Lift Stations: Costs associated with pumping wastewater within the system.

Collection Systems - General: Costs associated with collection infrastructure that carries all wastewater generated by customers to the treatment plant. Benefits the system during both dry and wet weather.

Collection Systems – Wet Weather: All costs associated with collecting wastewater during heavy rain events or flooding, green infrastructure or other collection functions that manage wet weather flow.

Cogeneration: Costs associated with the use of digester gas by-product as a method of power generation.

Laboratory: Costs associated with sampling and laboratory analysis of samples. These costs may need to be further allocated between treatment and customer service (collection system sampling).

Customer Billing: All costs associated with producing customer bills, including billing system software, postage, credit card processing fees,

General: Costs associated with other treatment and administrative services that do not fit any of the other categories. Examples include electrical equipment, HVAC equipment, plant staff vehicles, etc.

Carollo determined the wet weather flow in three steps that involved analyzing treatment plant flows and weather patterns. First, we received daily flow data for each of the three treatment plants and matched it with daily rainfall data. For each treatment plant, we summed the days with no rainfall then divided by the number of days with no rainfall to calculate the average daily dry weather flow.

Second, we applied the average daily dry weather flow to the total number of days of recorded data to determine what portion of the total flow is considered to be dry weather flow. Finally, we subtracted the total dry weather flow from the total flow to determine the remaining portion that is considered to be wet weather flow.

$$\begin{array}{l} \textit{Dry weather} \\ \textit{flow allocation} \end{array} = \hspace{0.1cm} \frac{\textit{Total flow on days with no rainfall}}{\textit{Total number of days with no rainfall}} \hspace{0.1cm} x \hspace{0.1cm} \frac{\textit{Total number of days}}{\textit{Total flow}} \end{array}$$

This process was completed for the sum of the three plants to determine the allocation between wet weather flow and dry weather flow for the combined system. It was also completed for the two wastewater plants, excluding flows from the North Point Plant, to determine the split between wet weather and dry weather for the flow through the wastewater treatment process.

The SFPUC's budget was analyzed line-by-line. Details of how the O&M, debt service, and other expenditures were distributed among functional categories are shown in Appendix C.

Cost Components and Factors

It is necessary to allocate costs to cost categories that can be both measured at the treatment facilities and estimated or measured for each user. For the SFPUC wastewater facilities, these cost categories include flow and strength — COD, TSS, FOG — and Customer Service. These four cost categories are referred to as billable constituents. In addition to these five, an AAO category is included for costs that are reallocated across every functional category.

The SFPUC's budget was analyzed line-by-line. Details of how the O&M expenditures, debt service, and other expenditures were distributed between cost categories are shown in the functional allocation in Appendix C. The following describes the functional cost categories primarily related to flow, strength, and customer service:

Flow: Operating and capital costs incurred by the wastewater system to handle the quantity of flows discharged to or collected by the system. The total flow is the sum of wet weather and dry weather volume. Wet weather is the condition when peak flow occurs such as a storm event with stormwater runoff. Dry weather flows average 73 MGD, whereas wet-weather flows average 255 MGD, as determined by cross-referencing treatment plant inflow data with rainfall data.

Total Suspended Solids (TSS): TSS measures the quantity of suspended solids or non-filterable residue in the wastewater. Costs include those associated with removing and disposing of small particles in the wastewater. Activities that have a larger allocation to TSS include sludge thickening, digestion, and solids handling and disposal processes.

Fats, Oils, and Grease (FOG): Cost for cleaning the collection system and treating, and disposing of fats, oils, and grease discharged to the sewer system. FOG can coat the lining of sewers and restrict the performance of the collection system.

Chemical Oxygen Demand (COD): During treatment, microbial organisms consume dissolved oxygen while oxidizing the organic matter present in wastewater. COD measures the quantity of oxygen required for that process. Expenses include costs incurred to remove and dispose of organic compounds.

Customer Service: Costs that relate to operational support activities including accounting, billing, customer service, administrative, and technical support. These are common to all customers.

Over time, the expenditures associated with each billable constituent change, but the process-specific percentage allocations to billable constituent should remain constant, absent a significant process change. To account for the variability in costs, the functional cost allocation apportions the annual revenue requirement over an average of the forecasted expenditures from FY 2019 through FY 2022 by major function of the wastewater utility. Utilizing the four-year average accounts for slight annual shifts in costs over the course of the study period.

This functional allocation process provides a reasonable, appropriate, and industry-standard basis for proportionately distributing costs to system customers and is grounded in cost of service principles and standards. This methodology and process also provides the basis for the rate structure detailed in the Wastewater Rate Design chapter. For this study, Carollo separated out specific allocations to customer service with the goal of recommending a new monthly service charge for the SFPUC Wastewater Enterprise. The Wastewater Rate Design chapter also introduces the new monthly service charge. The changes made to the cost of service allocations since the 2014 study, as well as changes to the operations and capital-related costs, shifted the overall allocation of revenue requirements slightly from flow, COD, and FOG, to TSS and customer service.

Wastewater Allocations

Wastewater Enterprise Assets

For some debt issues, the information required to allocate the debt service payments based on the projects funded with the proceeds is not available. For these debt issues, we substitute the overall allocation of the wastewater system's fixed assets. As with the water assets, we first allocate the wastewater fixed assets to functional categories based on the various allocation, location, and class codes provided in the fixed asset register. The updated allocation of fixed assets resulted in a shift of the fixed asset capital allocation factors from flow to COD and FOG.

Table 55 summarizes the allocation factors applied to system assets.

| TABLE 55 WASTEWATER ENTERPRISE AS | SSET ALLOCATION | ON | | | | | |

| Percentage | 100% | 76.5% | 10.4% | 8.7% | 4.4% | 0.0% | 0.0% | | | | | | | |

Notes:

- (1) Values are rounded and expressed in million dollars. Numbers may not add up due to rounding. Debt issue allocations are detailed in "Debt Service Allocations.xlsx."
- (2) Flow includes the sum of dry weather and wet weather volumes.
- (3) BABs are Build America Bonds.

Function-specific capital allocations are applied to both annual debt service payments on existing debt and projected future debt service required to fund planned capital project expenditures. To allocate future capital expenses – both debt service and revenue-funded capital – a separate "future capital" allocation was developed. The \$6.9 billion, 20-year SSIP and the repair and replacement projects of the 10-Year Capital Plan outline the planned capital improvement projects and are the basis of the future capital expenditures. Projects outlined in the SSIP were categorized by the associated assets and subsequently allocated to the billable constituents. As the SSIP is currently in Phase I, only the planned projects for Phase I were used to allocate costs to the billable constituents to account for costs incurred during the upcoming four-year rate period. Similarly, only the first four years of R&R capital projects were allocated to functions for this rate package.

Wastewater Enterprise O&M Costs

Operating expenses incurred by the SFPUC result from materials, power, chemical costs, and labor. These expenses were separated by categories and, where applicable, subcategories. Carollo worked with SFPUC staff to identify the services provided by each department and the appropriate associated functional categories. The allocations percentages are estimates based on discussions with SFPUC staff. Table 58 summarizes the allocation of the four-year average from FY 2019 through FY 2022 in order to account for changes in expenditures.

- [1] Values are rounded and expressed in million dollars. Numbers may not add up due to rounding.
- (2) As All Others allocation is reallocated across the other functional components.
- (3) A portion of Administration costs are allocated to Customer Billing to reflect Customer Service and billing activities.
- [4] Planning and Regulation costs are allocated based on assignment of FTEs to functional allocations from "Wastewater Ops Labor assignments.xlsx."
- [5] Maintenance costs are allocated based on assignment of labor and purchase orders to functional allocations from "WWE Maintenance Percentages" email from E. Butawan to E. Franks date November 14, 2017.
- (6) Operations costs are allocated based on the services provided by Operations staff and an estimate of the division of labor among functional categories ("Wastewater Ops Lab-assignment.xlsx"). Operations All Other Expenses are allocated based on the weighted allocation of all other Operations costs.
- [7] Source Control costs are allocated based on assignment of FTEs to functional allocations from "Collection System FTE Allocations Filled In.xlsx."

Each operating budget line item was allocated to its appropriate functional rate components. Table 59 summarizes the allocation of the functionalized costs from Table 58 to the rate components. O&M cost allocations differ from capital cost allocations because billing parameters influencing the costs to operate and maintain a process are not always the same as the parameters influencing the design and construction of a process.

Other Wastewater Enterprise Expenses

In addition to O&M expenses, the Wastewater Enterprise budget includes other expenses, including Programmatic Expenses and Non-Debt Capital Expenses. Table 61 summarizes the allocation of these other expenses using the four-year average from FY 2019 through FY 2022 in order to account for changes in expenditures. Programmatic and Non-Debt Capital Expenses are allocated by individual project.

| TABLE 61 WASTEWATER ENTERPRISE OTHER | EXPENSES ALL | OCATION (FY 2 | 019 - FY 2022 | AVERAGE) | | | |

- (3) As All Other allocation will be reallocated across the other functional components based on the total revenue requirements.

Offsetting Revenue

Wholesale sales revenue and other non-rate revenue are used to offset the revenue requirements and reduce the required increase in rate revenue. These offsetting revenues are also allocated to the cost components line-by-line. If the revenue directly offsets an expense, it is allocated the same as that expense. For example, programmatic revenue is allocated the same as programmatic expenses. Table 62 summarizes the allocation of offsetting revenue using the four-year average from FY 2019 through FY 2022.

| TABLE 62 WASTEWATER ENTERPRISE OFFSET | TING REVENUE | S ALLOCATION | l (FY 2019 - FY | 2022 AVERAG | E) | | |

- (5) Federal Bond Interest Subsidy is allocated based on the allocation of the BABs.
- (6) Programmatic revenue is allocated based on the allocation of the individual programmatic projects.
- (7) Non-debt capital revenue is allocated based on the retail share of the individual future capital projects.

Wastewater Enterprise Revenue Requirements Allocation

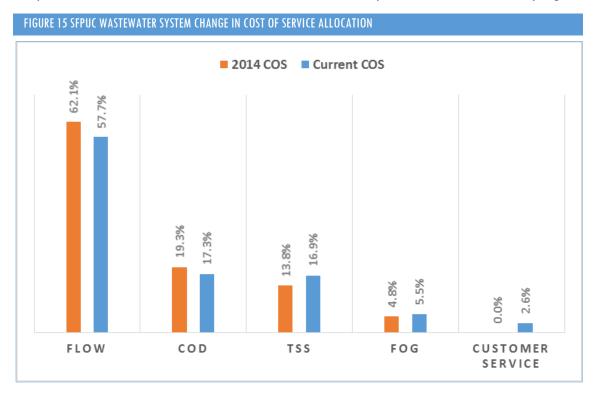

To obtain an overall percentage allocation, operating expenses, existing and future debt service, other expenses and offsetting revenues are weighted based on their average annual expenditures over the four-year rate-setting period. Once the overall percentage allocation to functional category has been defined, those percentages, as shown in Table 63, are applied to the revenue requirements for the four-year rate period FY 2019 through FY 2022 in order to calculate the unit costs.

| TABLE 63 WASTEWATER ENTERPRISE ALLOCATION OF REVENUE REQUIREMENTS (FY 2019 - FY 2022 AVERAGE) | | | | | | | | | |

- (3) As All Other allocation is reallocated across the other functional components.

Based on the analysis described above, the customer service component, which includes administrative and billing activities, represents 2.6 percent of forecasted costs and is the foundation for the recommended new monthly fixed charge. The remaining 97.4 percent of costs are allocated to flow and strength components and are the basis for the recommended commodity rates. This is illustration by Figure 15.

The SFPUC currently does not have a fixed charge for the wastewater system. As part of this cost of service study, Carollo recommends the introduction of a fixed charge in order to provide additional revenue stability and to recover costs that do not vary with wastewater flows.

FUNCTIONAL ALLOCATION RESULTS

Unit Cost and Customer Allocation

The unit costs of service are developed by dividing the total annual costs allocated to each of the five cost components by the total annual service units of the respective component. The total annual costs allocated to each cost component are determined by applying the percent allocation summarized in Table 63 to the annual revenue requirement. Ultimately, the revenue requirement is allocated in three steps:

Step 1: Allocate to several specific functional categories

Step 2: Allocate to cost components intended to provide structure to the rates

Step 3: Allocate to each customer class based on a quantitative review of its specific contribution to the sewer system

Following these steps, the revenue requirements for each customer class form a reasonable and cost of service-driven basis for developing rates.

Units of Service

In order to allocate the cost of service to various customer classes, unit costs of service are developed for each functional cost component. As shown in Table 63, the total FY 2019 rate revenue requirements are allocated to each functional component using the allocation presented in Figure 15. The total cost for each functional category is then divided by the total number of associated units of service to determine appropriate unit costs for the Wastewater Enterprise. Based on functional category, the units of service are wastewater billable volume, COD mass, TSS mass, FOG mass, and the number of accounts. The following describes the quantifiable analysis of the units of service:

Flow: Allocated based on the assumed discharge or return to the SFPUC sewer collection system in ccf of discharge flow.

COD: Allocated based on pounds of COD returned to the system.

TSS: Allocated based on pounds of TSS returned to the system.

FOG: Allocated based on pounds of FOG returned to the system.

Customer Service: For this fixed component, the customer component unit cost is based on the number of accounts.

Similar to the water system's demand analysis, minimal account growth is expected during this four-year rate study. Additionally, account growth is expected to be offset by continued conservation so that the annual discharge volume is assumed to remain at existing levels throughout the study's forecast. SFR and MFR customer classes share wastewater strength assumptions due to the similarity in the residential wastewater characteristics.

However, nonresidential wastewater strength characteristics vary greatly within the class, depending on the type of business. For the duration of the rate period, it is assumed that total loadings by customer class remains consistent. Based on available historical customer data and these forecasting assumptions, Table 64 details the total units of service for each customer class and functional category predicted for FY 2019. This customer data is then used to determine appropriate proportional allocation of revenue needs to customer classes.

| TABLE 64 WASTEWATER ENTERPRIS | E UNITS OF SERVICE (1 |) | | | |
|-------------------------------|-----------------------|--------------|--------------|--------------|-----------------------------|
| CUSTOMER CLASS | FLOW (CCF) | COD (LBS) | TSS (LBS) | FOG (LBS) | CUSTOMER SERVICE (ACCOUNTS) |
| Single Family Residential | 5,995,178 | 25,599,859 | 10,442,047 | 3,181,269 | 111,072 |
| Multifamily Residential | 9,794,389 | 41,822,776 | 17,059,289 | 5,197,275 | 36,171 |
| Nonresidential | 7,885,080 | 36,758,773 | 12,207,135 | 4,551,904 | 16,075 |
| Total | 23,674,647 | 104,181,408 | 39,708,471 | 12,930,448 | 163,319 |
| Note: | | | | | |

(1) FY 2016 units of service.

Unit Cost Development

In order to allocate costs of service to the different user classes, unit costs of service were developed for each functional component. As shown in Table 65, the unit costs of service are developed by dividing the total annual costs allocated to each functional component by the total annual service units of the respective category. The unit costs of each component are then applied to each customer classes' projected flow, loadings, and accounts to derive customer class allocations. Projections are based on current use and account growth assumptions. As such, costs are allocated to each customer class based on their respective discharge characteristics.

| TABLE 65 WASTEWATER ENT | ERPRISE UNIT COST (FY 20 | 019) | | | |
|---|---------------------------------------|-------------------|-------------------|-------------------|--|
| | FLOW (1) | COD | TSS | FOG | CUSTOMER SERVICE |
| Allocation Percent | 57.7% | 17.3% | 16.9% | 5.5% | 2.6% |
| Value Allocable to Component (A) (2) | \$186.4 | \$56.0 | \$54.5 | \$1 <i>7</i> .9 | \$8.6 |
| Total Units (B) | 24,156,924 | 106,189,808 | 40,573,659 | 13,180,295 | 163,807 |
| Allocation Basis | Annual Volume (ccf) ⁽³⁾ | Strength (lbs) | Strength (lbs) | Strength (lbs) | Customer Accounts/mo ⁽⁴⁾ |
| Per Unit Cost (5) = A ÷ B | \$7.72 | \$0.53 | \$1.35 | \$1.36 | \$4.36 |

Notes:

- (1) Flow includes the sum of dry weather and wet weather volumes.
- (2) Values are rounded to the nearest million dollar.
- (3) Annual unit cost is divided by 12 months to get monthly unit cost.
- (4) ccf is one hundred cubic feet. 1 ccf = 748 gallons.
- (5) Unit costs are rounded up to the nearest \$0.01.

Customer Allocation

Table 66 details the results of the functional cost allocation analysis based on FY 2016 wastewater characteristics provided in Table 65.

| | PERCENT ALLOCATION (%) | | | | |
|---------------------------|------------------------|-------|-------|-------|---------------------|
| CUSTOMER CLASSES | FLOW (1) | COD | TSS | FOG | CUSTOMER SERVICE |
| Single Family Residential | 25.8% | 25.1% | 26.8% | 25.1% | 68.0% |
| Multifamily Residential | 42.1% | 40.9% | 43.7% | 40.9% | 22.1% |
| Nonresidential | 32.1% | 34.0% | 29.6% | 34.0% | 9.8% |
| Total | 100% | 100% | 100% | 100% | 100% |

(1) Flow includes the sum of dry weather and wet weather volumes.

Based on available consumption and customer records, Table 67 details the proportional allocation of revenue requirements to the customer classes.

| TABLE 67 WASTEWATER SYSTEM ALL | OCATION OF REVENUE | REQUIREMENTS BY | CUSTOMER CLASS | (1) | |
|--------------------------------|--------------------|-----------------|----------------|--------|---------------------|
| CUSTOMER CLASSES | FLOW (2) | COD | TSS | FOG | CUSTOMER SERVICE |
| Single Family Residential | \$48.1 | \$14.0 | \$14.6 | \$4.5 | \$5.8 |
| Multifamily Residential | 78.5 | 22.9 | 23.8 | 7.3 | 1.9 |
| Nonresidential | 59.8 | 19.1 | 16.1 | 6.1 | 0.8 |
| Total | \$186.4 | \$56.0 | \$54.5 | \$17.9 | \$8.6 |

Notes:

- (1) Values are rounded and expressed in million dollars. Numbers may not add up due to rounding.
- (2) Flow includes the sum of dry weather and wet weather volumes.

The wastewater rate design analysis determines how the costs are recovered by each customer through specified wastewater rates. The focus of this process is to achieve cost recovery and substantiate that customers are paying their fair and proportionate share of system costs. The SFPUC's existing rate structure consists of a commodity rate (variable) only. The commodity rate is assessed based on discharge volume and strength. A fixed charge is recommended to recognize that the utility incurs fixed costs to provide service, which must be recovered independent of discharge characteristics. These two rate components serve as a basis for the next chapter's rate design.

8. WASTEWATER RATE DESIGN

Carollo's rate review and analysis confirms that the SFPUC rate structures are sound and adhere to industry best practices. This chapter discusses the recommended updates to the rates and charges to remain compliant with cost of service requirements based on the unique nature of the SFPUC wastewater system and customer demand patterns. The purpose of a cost of service analysis is to provide a rational basis for distributing the costs of the SFPUC water and wastewater systems to each customer class in proportion to the demands they place on the systems. A detailed cost allocation was developed for the Wastewater Enterprise based on the unique attributes of the system in order to meet the equity requirements of Proposition 218, the San Francisco City Charter, and SFPUC policy. The Charter requires that the City perform a cost of service study at least every five years so that revenues from rates are adequately funding utility operations, maintenance, and ongoing capital needs, and equitably recover costs from system users. Additionally, in California, wastewater rates must adhere to the cost of service requirements imposed by Proposition 218 of the State Constitution. Proposition 218 requires that property-related fees and charges, including wastewater rates, do not exceed the proportional cost of providing the service.

The rates presented within this chapter adhere to cost of service principles, as well as industry standards set by the WEF. The wastewater rate design determines how the revenue requirements are recovered by each customer through specific wastewater rates. The focus of this process is to achieve full cost recovery and substantiate that customers are paying their fair and proportionate share of system costs.

EXISTING WASTEWATER RATE STRUCTURE

As part of this analysis, the existing wastewater rate structure was reviewed to assess its effectiveness in addressing the SFPUC's utility cost of service objectives. The SFPUC last performed a cost of service rate analysis in 2014. Based on the recommendations at that time, the SFPUC transitioned from a two-tiered rate structure, which was implemented in 2009, to the current uniform structure for residential customers. Unlike water rates, retail wastewater revenues are currently recovered entirely on flow-based charges, as there is currently no monthly fixed service charge associated with the wastewater rate structure. The rate is charged based on the assumed amount of metered water usage that is returned to the wastewater system. The current uniform (non-tiered) flow-based rate is comprised of elements that reflect the volume (flow) and strength of sewer discharge as summarized in Table 68. Residential rates are based on the assumption that residential customers have a standard strength for domestic sewage. Nonresidential customers incur a rate related to flow and separate rates for each unit associated with three strength characteristics.

Wastewater service charges cover the cost of collecting, transporting, treating, and disposing of each unit of wastewater discharged into the sewer system. Wastewater service charges are calculated by multiplying water consumption by an assigned flow factor. The flow factor is the percentage of metered water use returned to the sewer system as wastewater. For purposes of determining applicable charges, the percentage of water use returned to the sewers (flow factor) is assumed to be 90% for single family residential users and nonresidential users and 95% for multifamily residential users.

| CUSTOMER CLASS | WASTEWATER RATE |
|-----------------|------------------------|
| Residential: | |
| SFR (\$/ccf) | \$12.40 |
| MFR (\$/ccf) | \$12.40 |
| Nonresidential: | |
| Flow (\$/ccf) | \$7.664 |
| COD (\$/lb) | \$0.548 |
| TSS (\$/lb) | \$1.033 |
| FOG (\$/lb) | \$1.082 |

SELECTING RATE STRUCTURES

Once costs have been equitably allocated to each functional component, the SFPUC has flexibility in designing the rate structure in order to meet its various policy objectives. In determining the appropriate rate level and structure, Carollo analyzed various rate design alternatives and the corresponding customer and utility implications. Beyond the identified study objectives, Carollo identified additional criteria for consideration and discussed them at length with SFPUC staff.

PARTIAL LIST OF THE ADDITIONAL ELEMENTS DESIRED IN THE RATE STRUCTURE:

Be clear and understandable

Encourage conservation and water efficiency

Follow cost of service principles

Provide revenue stability

Maintain affordability

Comply with legal and regulatory requirements

Abide by policy objectives

Given the numerous and, at times, competing elements, selection of an appropriate rate structure is complex. There is no single rate structure that meets all objectives equally, nor are all objectives or elements valued the same by the utility or customers.

Each criteria or element has merit and plays an important role in the rates implementation and overall effectiveness. These elements and competing objectives were discussed and evaluated at length throughout the financial and rate study process.

cost neutral for the overall enterprise revenue requirement.

MONTHLY SERVICE CHARGE

Carollo recommends implementation of a fixed monthly service charge to recover costs associated with customer service and billing. Because these costs are not related to customer flow and strength characteristics, we recommend a flat monthly charge that does not vary by meter size or customer class. Table 69 shows the calculation of the recommended monthly service charge for FY 2019. This cost recovery will be removed from the current commodity rate to keep this change

| TABLE 69 WASTEWATER MONTHLY SERV | ICE CHARGE CALCULATION |
|-------------------------------------|------------------------|
| DESCRIPTION | VALUE |
| Service Costs (A) | \$8,387,888 |
| Number of Monthly Bills (B) | 1,965,684 |
| Monthly Service Charge $= A \div B$ | \$4.27 |

COMMODITY RATES

Similar to water customers, wastewater customer classes are evaluated separately to determine unit costs more specific to their customer category. Units of wastewater discharge are determined based on metered water consumption. To recognize that a portion of water usage does not return to the wastewater system, a standard customer return factor is applied to metered water usage. The return to sewer factor varies by customer class, recognizing the greater level of outside irrigation by single family and nonresidential users compared to multifamily users. Individual customers may appeal the default flow factor based on their actual water use characteristics.

Wastewater loading strength is assumed to be commensurate for all residential wastewater users at 684 mg/L COD, 279 mg/L TSS, and 85 mg/L FOG. Because of this standardized assumption, the costs associated with loadings may be rolled up into one rate applied to residential users based on discharge flow. In other words, the residential rate assessed for flow includes costs associated with loadings. However, nonresidential customer loadings vary greatly so their flow rate does not include costs associated

with loadings. Separate loadings charges are applied to their assumed loadings by customer type to determine the total wastewater bill.

Residential

Residential customers are charged a uniform rate of \$12.40 per ccf of estimated wastewater flow. Again, the amount discharged is assumed to be 90 percent of monthly water consumed for single family residential customers and 95 percent of monthly water consumed for multifamily residential customers. This flat per unit charge continues to encourage conservation as it is directly tied to the customer's water demands. Table 70 and Table 71 show the calculation of the FY 2019 volumetric rate for single family and multifamily residential wastewater customers, respectively. As shown, the calculated rate is the same for both types of residential customers because the assumed loadings per unit of flow are the same.

| TABLE 70 SINGLE FAMILY RESIDENTIAL CALCULATION | L WASTEWATER RATE |

| DESCRIPTION | VALUE |
| Flow Costs (A) | \$78,476,546 |
| COD Costs (B) | \$22,901,841 |
| TSS Costs (C) | \$23,792,257 |
| FOG Costs (D) | \$ 7, 31 7,77 1 |
| Consumption (ccf) (E) | 10,169,290 |
| Rate = (A+B+C+D) ÷ E | \$13.03 |

Nonresidential

Nonresidential users currently pay a uniform volume rate of \$7.66 for each unit of wastewater flow, which is based on a 90 percent return factor applied to metered water usage for nonresidential customers. In addition, nonresidential customers are assessed separately for each billable constituent. These charges are based on the assumed loading concentrations (strength parameter) that are returned per discharge unit for various types of nonresidential customers. For COD, the current charge is \$0.548 per pound. The strength charges for TSS and FOG are \$1.033 and \$1.082 per pound, respectively. Nonresidential strengths can vary significantly between users. Defined strengths are based on periodic sampling data on a customer-by-customer basis or the customer's standard industrial classification code, if no sampling data is available.

As discussed, the recommended rates are calculated by dividing the total annual costs associated with each cost component by their associated total annual units. Nonresidential customers are billed by applying the appropriate SIC code classification to the recommended unit costs. This means the cost per unit (ccf) of water discharged to the system will vary by SIC code to reflect the assumed loadings concentrations specific to commercial property type.

Table 72 through Table 75 show the calculation of the nonresidential rates.

RECOMMENDED SFPUC WASTEWATER RATES

In an effort to reduce rate shock as a result of introducing the wastewater monthly sewer service charge, Carollo recommends phasing in the wastewater monthly service charge to the cost of service monthly service charges calculated for FY 2022 over the next four years. For this reason, the recommended rates for FY 2019 differ from the calculated rates shown previously in this section. The recommended rates for FY 2019 through FY 2022 are summarized in Table 76. Throughout the rate-setting process, Carollo worked closely with SFPUC staff to evaluate the impact of the recommended rate structure to wastewater customers.

| TABLE 76 RECOMMENDED WASTEWATER RATE | ζ (1) | | | | |
|--------------------------------------|---------|---------|---------|---------|---------|
| | CURRENT | | | | |
| DESCRIPTION | FY 2018 | FY 2019 | FY 2020 | FY 2021 | FY 2022 |
| Monthly Service Charge (\$/month) | None | \$0.99 | \$2.27 | \$3.77 | \$5.51 |
| Residential: | | | | | |
| SFR (\$/ccf) | \$12.40 | \$13.28 | \$14.39 | \$15.58 | \$16.88 |
| MFR (\$/ccf) | \$12.40 | \$13.28 | \$14.39 | \$15.58 | \$16.88 |
| Nonresidential: | | | | | |
| Flow (\$/ccf) | \$7.66 | \$8.16 | \$8.73 | \$9.34 | \$9.99 |
| COD (\$/lb) | \$0.548 | \$0.574 | \$0.609 | \$0.645 | \$0.684 |
| TSS (\$/lb) | \$1.033 | \$1.164 | \$1.334 | \$1.525 | \$1.740 |
| FOG (\$/Ib) | \$1.082 | \$1.221 | \$1.380 | \$1.558 | \$1.757 |

⁽¹⁾ Charge is rounded up to the nearest \$0.01 (\$0.001 for nonresidential commodity loadings).

⁽²⁾ ccf is one hundred cubic feet. 1 ccf = 748 gallons.

CUSTOMER IMPACTS

Figure 16 illustrates the impact of the recommended wastewater rates to SFR customers across various usage levels.

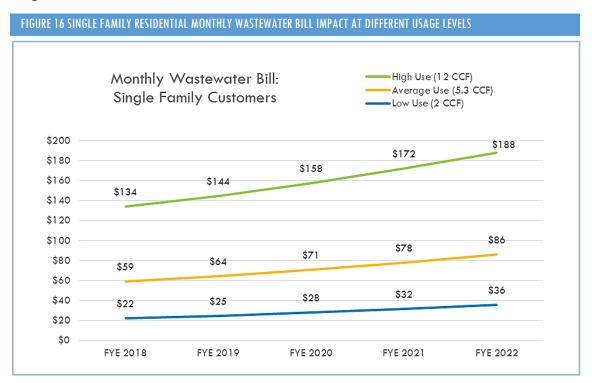

Figure 17 illustrates the impact of these recommended wastewater rates to MFR customers across various usage levels.

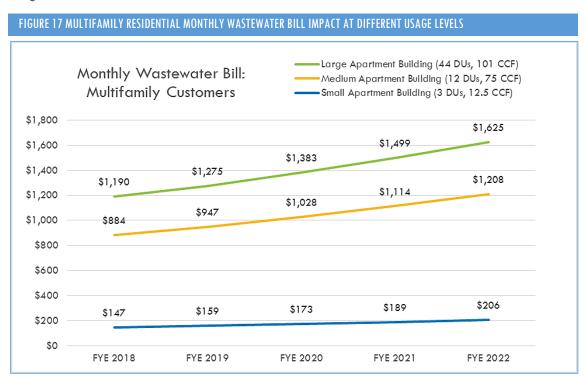

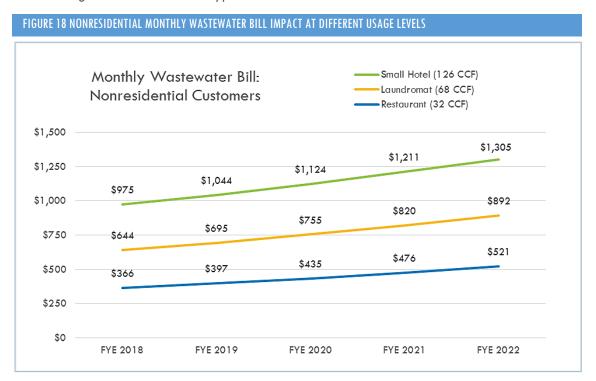

Figure 18 illustrates the impact of these recommended wastewater rates to nonresidential customers across various usage levels and business types.

DROUGHT SURCHARGE

To enhance revenue stability for wastewater operations, Carollo recommends the SFPUC implement drought surcharges to be applied to wastewater rates during periods of reduced water demand, and therefore reduced wastewater flows, associated with drought conditions. As discussed in the Wastewater Cost of Service chapter, over 97 percent of SFPUC's revenues are variable in that they fluctuate with changes in water demands. A drought surcharge will allow the SFPUC to react to revenue shortfalls driven by sustained decreases in sales due to drought, supply limitations, or other circumstances, and would only be assessed if SFPUC declares water supply shortages. The overall required surcharge is based on the final formula:

$$Surcharge (\$ per ccf) = \frac{Wastewater Revenue Shortfall from reduced flow}{Reduced Wastewater Flow}$$

The proposed drought surcharge aims to give SFPUC the flexibility to adapt to changes in usage, revenues, and costs.

9. CAPACITY CHARGES

A capacity charge is designed to recover a fair and proportional share of the cost to provide capacity to serve future users and is imposed as a condition of service for new usage, an increase in usage, or a change in usage. The SFPUC adopted a wastewater capacity charge in July 2005 and a water capacity charge in 2007. The capacity charge adopted by the SFPUC is based on a buy-In methodology. Conceptually, this methodology requires future users to buy into the value of the existing systems. Existing customers have invested in the SFPUC water and wastewater systems and as a result these systems have adequate capacity to meet the needs of future customers or additional needs of existing customers. This chapter delineates the methodology for the existing water and wastewater capacity charges and the calculation of the recommended updated capacity charges.

BACKGROUND

Water System

The water capacity charge went into effect January 1, 2009, pursuant to City and County of San Francisco Public Utilities Commission Resolution No. 07-0099 adopted on June 12, 2007. The resolution requires any user requesting a new connection to the water distribution system, or requiring additional capacity as a result of any addition, improvement, modification, or change in use of an existing connection, to pay a capacity charge. The capacity charge is adjusted annually based on ENRCCI values.

The current water capacity charge is 1,346 per 5/8-inch meter as of July 1, 2017.

Wastewater System

The wastewater capacity charge went into effect July 1, 2005, in accordance with Resolution No. 05-0045. On January 1, 2009, the Resolution No. 05-0045 was updated pursuant to City and SFPUC Resolution No. 07-0100 adopted on June 12, 2007. The resolutions require any user requesting a new connection or requiring additional wastewater collection and treatment capacity to pay a wastewater capacity charge. The capacity charge is adjusted annually based on ENRCCI values.

The current wastewater capacity charge is 4,583 per 5/8-inch meter as of July 1, 2017.

METHODOLOGY

Two general approaches are used to calculate capacity charges sufficient to recover system investments from new users. The first approach, the buy-in methodology, is based on the existing system's capacity and is designed to recover costs from development investments made by existing users to provide available capacity for future users. The second approach, the incremental cost method, recovers costs of planned investments that the utility will undertake to add capacity necessary to serve future development.

The City of San Francisco has experienced minimal projected growth in flow since the last capacity charge study completed in 2014, and the population is projected to grow at 0.1 percent per year through the rate projection period ending in FY 2022, whereas, water use is projected to decrease slightly given ongoing conservation initiatives and price elasticity based on recommended rate adjustments.

Planned capital investments are primarily to repair or replace existing system infrastructure for both the wastewater and inside City water system (portion of the SFPUC water system designed to provide potable water service to users residing within or immediately adjacent to the city limits). Moreover, excess capacity is available in both systems to serve the projected growth. The buy-in approach is most appropriate when the existing system has adequate capacity to serve both existing and future users and no significant capacity-related capital improvements are planned. Consequently, we consider that the buy-in approach best reflects the cost of providing available capacity to new customers in the retail service area.

Under the buy-in methodology, future users are required to reimburse existing users for equity that they have contributed over time through rates and fees. This is determined by dividing the total ratepayer system equity by the total system capacity. Ratepayer equity is defined as the replacement value of the existing system less outstanding debt principal and accumulated depreciation plus current assets such as cash reserves. System capacity is defined as the total capacity within the water or wastewater system available to serve system users.

Ratepayer Equity

The buy-in capacity charge approach requires that new users buy into the water or wastewater system equity that existing users have funded through rates and charges. Ratepayer equity is comprised of two components – net capital asset equity and reserves.

Net Capital Asset Equity

Net Capital Asset Equity represents the current value of the physical water or wastewater systems funded by existing ratepayers, net of accumulated depreciation². Capital costs not funded by existing ratepayers, such as grant-funded or developer-contributed assets, are excluded from the ratepayers' equity calculation. Additionally, capital costs financed through bonds are reduced by the total of the outstanding debt principal, to reflect those costs not yet incurred by ratepayers.

This analysis includes only the net capital assets associated with the portion of the SFPUC system that provides service to the inside City service area and suburban retail customers. Regional and wholesale assets are not included in the calculations. The following are components that are considered in the calculation of the recommended capacity charges:

Capacity Charge Cost Component

Trended Existing Plant-In-Service: Current value of the existing water or wastewater system.

Original costs are escalated to December 2017 dollars using the ENRCCI.

Construction Work-In-Progress: Capital projects currently under construction, not captured in the Existing Plant-In-Service asset records.

Accumulated Depreciation: Represents the loss in value of the system as the useful life of that asset is exhausted.

Outstanding Debt Principal: Represents amortized capital project costs not yet funded by existing ratepayers. As debt is retired, through the use of either user rates or capacity charge revenues, the retired debt principal becomes part of the asset equity.

Unamortized Grants: Grant-funded assets are excluded from the capital asset equity, because these are system assets not funded by ratepayers.

Reserves

Reserves and funds contributed by existing ratepayers are also included when calculating ratepayer equity. Some examples of reserves include:

Deposits with Fiscal Agent: Reserve funds held by a fiscal agent as a condition of the bond indenture. Cash in Capital Projects Fund: Reserve funds available for capital only projects.

Cash in Unrestricted Funds: Reserve funds available to meet Enterprise expenditure needs.

² Due to the naming convention used on the SFPUC's asset list, Carollo was unable to identify replacement assets on an asset-by-asset basis. Assets replaced by newly acquired assets were not removed from the Existing Plant-In-Service calculation. However, because the calculation accounts for accumulated depreciation of assets, only the monetary value associated with the remaining useful life of each asset is considered in the calculation.

Ratepayer equity is calculated for the water Enterprise and wastewater Enterprise in Table 77 and Table 78, respectively.

| TABLE 77 WATER SYSTEM RETAIL RATEPA | YER EQUITY |
|--------------------------------------|------------------------|
| DESCRIPTION | ADJUSTED ORIGINAL COST |
| Net Capital Asset Equity | |
| Land, Building, and Equipment | \$6,124,521,137 |

| Total Ratepayer Equity | \$2,237,148,517 |

Notes:

System Capacity

Water System

The SFPUC provides water to nearly 2.7 million people in the San Francisco Bay Area. The water system supplies water to in-City customers, as well as suburban retail and wholesale customers. The capacity charge presented in this report will be levied only on in-City customers and suburban retail customers. When analyzing demands placed on the system, its capacity is typically distinguished used, available, or total. The available capacity within the system does not adequately reflect the water demands that the system was designed to provide.

Consequently, total system capacity expressed in MEs is the most appropriate capacity basis of the system. A hydraulic analysis of the in-City and suburban retail system in 2007 found the maximum system capacity to be 127 million gallons per day, equivalent to 635,000 MEs. Capital improvements since 2007 have not increased the capacity of the in-City and suburban retail system. Therefore, this analysis will retain the maximum system capacity of 635,000 MEs for the calculation of capacity charges.

Wastewater System

The SFPUC provides wastewater service to the customers within the City of San Francisco and adjacent communities. The wastewater treatment facilities have a total average dry weather flow capacity of 85.4 MGD at the Southeast Wastewater Treatment Plant (WWTP) and 21.0 MGD at the Oceanside WWTP for a total of 106.4 MGD. This capacity serves both customer discharges, as well as groundwater infiltration. The current capacity charge is calculated based on the total system capacity available to serve customers, 93.5 MGD. Assuming 200 gallons per day (gpd) demand per 5/8" ME, this translates to 468,000 MEs.

Total Net Capital Asset Equity is calculated based on escalating original values using the ENRCCI 20-City Average as of December 2017; it is not a generally accepted account principles (GAAP) balance sheet calculation.

Total Net Capital Asset Equity is calculated based on escalating original values using the ENRCCI 20-City Average as of December 2017; it is not a generally accepted account principles (GAAP) balance sheet calculation.

RECOMMENDED CAPACITY CHARGES

Currently, the water and wastewater capacity charges are assessed by meter size. Carollo recommends that the SFPUC continue to assess water capacity charges based on the size of the installed water meter, increasing the charge commensurate to the increase in flow rate above a 5/8-inch meter. Meter size is commensurate with flow rate and reflects the potential capacity demand on the system. It is assumed that the greater the size of the meter, the greater the capacity demand that the user can place on the water and wastewater systems.

The water and wastewater capacity charges are calculated by dividing the ratepayer equity by total system capacity, as illustrated in Table 79. The significant increase in the water capacity charge is primarily due to the projects associated with the WSIP rolling onto the asset list. However, the accumulated depreciation is not increasing at the same rate because of the large number of assets that are fully depreciated.

| TABLE 79 CAPACITY CHARGE CALCULATIONS | | |
|---------------------------------------|-----------------|-------------------|
| DESCRIPTION | WATER SYSTEM | WASTEWATER SYSTEM |
| Ratepayer Equity | \$1,156,390,852 | \$2,237,148,517 |
| Number of MEs | 635,000 | 468,000 |
| Calculated Capacity Charge per ME | \$1,821 | \$4,780 |
| Existing Capacity Charge per ME | \$1,346 | \$4,583 |
| Capacity Charge Increase (%) | 35% | 4% |

Water Capacity Charge

Based on the calculation shown in Table 79, Carollo recommends that the SFPUC adopt a water capacity charge of \$1,821 per 5/8-inch ME. Table 80 shows the recommended water capacity charges for all meter sizes based on the ratio of the AWWA standard maximum flow rate through each meter size to the maximum flow rate through a 5/8-inch meter.

| TABLE 80 EXISTIN | G AND RECOMMENDED WAT | ER CAPACITY CHARGES BY METER S | SIZE | |
|-----------------------|---------------------------------|--------------------------------|--------------------------|-----------------------------|
| METER SIZE | AWWA MAXIMUM FLOW RATE (GPM) | METER EQUIVALENT RATIO | EXISTING CAPACITY CHARGE | RECOMMENDED CAPACITY CHARGE |
| 5/8 in. | 20 | 1.0 | \$1,346 | \$1,821 |
| 3/4 in. | 30 | 1.5 | 2,020 | 2,732 |
| 1 in. | 50 | 2.5 | 3,369 | 4,553 |
| $1 - \frac{1}{2}$ in. | 100 | 5.0 | 6,734 | 9,105 |
| 2 in. | 160 | 8.0 | 10,776 | 14,569 |
| 3 in. (1) | 320 | 16.0 | 20,204 | 29,137 |
| 4 in. | 500 | 25.0 | 33,673 | 45,527 |
| 6 in. | 1,000 | 50.0 | 67,349 | 91,055 |
| 8 in. | 1,600 | 80.0 | 107,758 | 145,687 |
| 10 in. | 2,500 | 125.0 | 154,821 | 227,636 |
| 12 in. | 4,300 | 215.0 | 289,448 | 391,534 |
| 16 in. | 7,500 | 375.0 | 504,852 | 682,909 |

Notes:

Wastewater Capacity Charges

Carollo recommends that the SFPUC adopt a wastewater capacity charge of \$4,780 per 5/8-inch ME based on the calculation in Table 79. Wastewater capacity charges vary by water meter size, similar to water capacity charges, but they also vary by SIC code, which accounts for assumed wastewater flows and strengths by property type.

Carollo recommends continuing to assess wastewater capacity charges based on both water meter size and SIC code. Properties with mixed use would be assessed wastewater capacity charges Based on water meter size and SIC code of 8812 (mixed use 50% + Residential) or 9993 (mixed use 50% + Non Residential), which are categorized under SIC Group 4.

Functional Allocation of Wastewater Capacity Charges

The first step in the development of the capacity fees is to complete a functional allocation of the wastewater ratepayer equity. The functional allocation breaks down the capacity charge by allocating asset values and liabilities (adjustments) to the following four functional cost components:

Table 81 shows the percentage allocations for each asset and liability group. The physical assets are allocated using the fixed asset allocation factors from the wastewater cost of service analysis. The construction work-in-progress is allocated using the future capital allocation factors from the cost of service analysis. The existing debt is allocated using the debt service allocation factors from the cost of service analysis. Finally, the non-physical assets are allocated using an As All Others allocation based on the allocation of the first three line items in Table 81.

⁽¹⁾ Carollo gathered data from the meter group for meter type and size accuracy. Adjustments were made to the 3-inch meter and the 10-inch meter ratios, due to these clarifications.

| TABLE 81 FUNCTIONAL COST COMPONENT ALLC | OCATION FACTORS | | | |
|---|---------------------------|-------|-------|-------|
| | FUNCTIONAL COST COMPONENT | | | |
| RATEPAYER EQUITY COMPONENT | FLOW | COD | TSS | FOG |
| Physical Assets | 79.3% | 8.1% | 2.9% | 9.7% |
| Construction Work-in-Progress | 55.6% | 19.0% | 21.0% | 4.3% |
| Existing Debt | 76.5% | 10.4% | 8.7% | 4.4% |
| Non-Physical Assets | 74.5% | 9.7% | 4.4% | 11.4% |

Using the functional allocation percentages in Table 81, Carollo allocated the values from Table 78 across the functional cost components. Then the total ratepayer equity for each functional cost component was divided by the total number of MEs to develop the wastewater capacity charge components, as shown in Table 82.

| TABLE 82 FUNCTIONAL ALLOCATION OF WASTEWAT | ER RATEPAYER EQUI | TY | | | |
|--|---------------------------|-------------|-------------------|-----------|-----------|
| | FUNCTIONAL COST COMPONENT | | | | |
| RATEPAYER EQUITY COMPONENT | TOTAL | FLOW | COD | TSS | FOG |
| Land, Building, and Equipment | \$8,499,487 | \$6,744,141 | \$689,81 <i>7</i> | \$214,936 | \$823,592 |
| Construction Work-in-Progress | 548,179 | 304,998 | 104,125 | 115,351 | 23,705 |
| Less: Accumulated Depreciation | (5,140,813) | (4,079,113) | (417,227) | (146,332) | (498,140) |
| Less: Outstanding Bonds and Loans | (1,185,349) | (906,926) | (123,573) | (102,680) | (52,170) |
| Less: Unamortized Grants | (724,886) | (575,180) | (58,832) | (20,634) | (70,241) |
| Net Capital Asset Equity | \$1,996,618 | \$1,487,919 | \$194,309 | \$87,642 | \$226,746 |
| Deposits with Fiscal Agent | 20,205 | 15,057 | 1,966 | 887 | 2,295 |
| Cash in Capital Projects Fund | 24,767 | 18,457 | 2,410 | 1,087 | 2,813 |
| Unrestricted Reserves | 195,559 | 145,734 | 19,032 | 8,584 | 22,209 |
| Total Ratepayer Equity | \$2,237,149 | \$1,667,168 | \$217,718 | \$98,200 | \$254,062 |
| Number of EDUs | 468,000 | 468,000 | 468,000 | 468,000 | 468,000 |
| Capacity Charge Component per EDU | \$4,780 | \$3,562 | \$465 | \$210 | \$543 |

The SFPUC has assumed varying loading concentrations to customer groups based on SIC code. Consequently, component capacity charges per ME must be adjusted for each SIC group's unique loading assumptions. Table 83 presents the loading assumptions for each SIC group designated by the SFPUC.

| | FU | INCTIONAL COST COMPONENT | |
|-----------------|------------|--------------------------|------------|
| SIC GROUP | COD (MG/L) | TSS (MG/L) | FOG (MG/L) |
| SIC Group 4 (1) | 684 | 279 | 85 |
| SIC Group 1 | 0 | 0 | 0 |
| SIC Group 2 | 194 | 56 | 26 |
| SIC Group 3 | 640 | 239 | 63 |
| SIC Group 5 | 641 | 224 | 86 |
| SIC Group 6 | 396 | 59 | 100 |
| SIC Group 7 | 1,387 | 171 | 112 |
| SIC Group 8 | 1,539 | 181 | 125 |
| SIC Group 9 | 1,616 | 284 | 137 |
| SIC Group 10 | 1,153 | 303 | 251 |
| SIC Group 11 | 4,921 | 1,371 | 559 |
| SIC Group 12 | 715 | 303 | 100 |

Notes:

 $\underline{\text{(1) SIC Group 4 contains all residential accounts. Group 4 concentrations are the assumed concentrations of a representative EDU.}$

To simplify the process of adjusting loading component capacity charges, ratios comparing each loading component in each SIC group, to that of a residential account have been calculated. Those ratios are used to scale the loading component capacity charges based on each SIC group's loading assumptions and are presented in Table 84.

| | FI | UNCTIONAL COST COMPONENT | |
|-----------------|------------|--------------------------|------------|
| SIC GROUP | COD (MG/L) | TSS (MG/L) | FOG (MG/L) |
| SIC Group 4 (1) | 1.0 | 1.0 | 1.0 |
| SIC Group 1 | 0.0 | 0.0 | 0.0 |
| SIC Group 2 | 0.3 | 0.2 | 0.3 |
| SIC Group 3 | 0.9 | 0.9 | 0.7 |
| SIC Group 5 | 0.9 | 0.8 | 1.0 |
| SIC Group 6 | 0.6 | 0.2 | 1.2 |
| SIC Group 7 | 2.0 | 0.6 | 1.3 |
| SIC Group 8 | 2.3 | 0.6 | 1.5 |
| SIC Group 9 | 2.4 | 1.0 | 1.6 |
| SIC Group 10 | 1.7 | 1.1 | 3.0 |
| SIC Group 11 | 7.2 | 4.9 | 6.6 |
| SIC Group 12 | 1.0 | 1.1 | 1.2 |

(1) SIC Group 4 contains all residential accounts. Group 4 concentrations are the assumed concentrations of a representative EDU.

Wastewater Capacity Charges for Industrial Customers

If a new customer does not fall within one of the established SIC Groups, the wastewater capacity charge may need to be assessed based on the customer's specific flow and loadings. In such a case, the capacity charge can be calculated by multiplying the customer's expected flow (gpd) and loadings (COD, TSS, and FOG in pounds (lb) per day) times the unit capacity charge for each component and then summing the products. Calculations of the unit capacity charges for each component are shown in Table 85.

| TABLE 85 CALCULATION OF WASTEWATER UNIT CAPACITY CHARGES FOR INDUSTRIAL CUSTOMERS BY COMPONENT | | | | | | | | |
|--|---------------------------|--------------|--------------|--------------|--|--|--|--|
| | FUNCTIONAL COST COMPONENT | | | | | | | |
| DESCRIPTION | FLOW | COD | TSS | FOG | | | | |
| Capacity Charge per ME (A) | \$3,562 | \$465 | \$210 | \$543 | | | | |
| Assumed Units per ME (B) | 200 gpd | 1.14 lbs/day | 0.47 lbs/day | 0.14 lbs/day | | | | |
| Unit Capacity Charge = (A / B) | \$17.81 | \$407.54 | \$450.65 | \$3,826.96 | | | | |

Table 86 provides an example calculation of the wastewater capacity charge for an assumed industrial customer.

Use of Capacity Charge Revenue

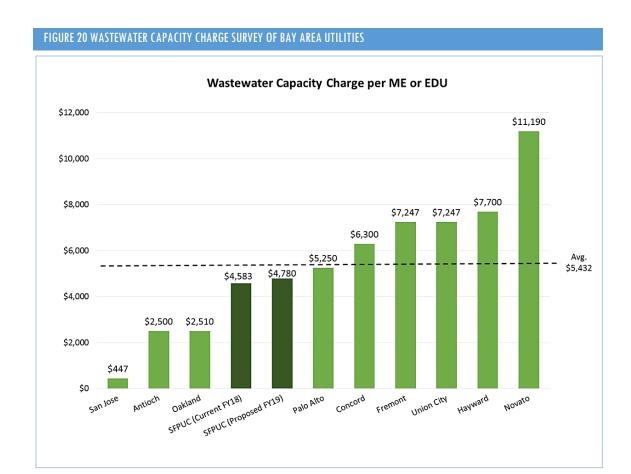

Existing reserves from previously assessed capacity charges and all future revenues collected from capacity charges should only be used for funding of capital projects. Due to the nature of the SFPUC's system, the capacity charge acts as a reimbursement to existing customers that have funded the system over time through rates. Accordingly, it would be appropriate to fund rehabilitation and replacement projects for the long-term benefit of future and existing ratepayers.

CAPACITY CHARGE COMPARISON

Carollo conducted a survey of nearby utilities to gather information about their water and wastewater capacity charges. Although utilities are not always alike, it is common to examine comparisons between similar or neighboring utilities. Figure 19 and Figure 20 compare typical water and wastewater capacity charges per equivalent dwelling unit, respectively, within the Bay Area.

Care should be taken in drawing conclusions from such comparisons as factors including locations, customer profiles, age of the system, and various operational and capital-related needs vary from agency to agency. As illustrated, despite the recommended increase to customers, capacity charges are below the average of nearby agencies.

INTRODUCTION

As a part of the Water and Wastewater Cost of Service Study, Carollo conducted a survey of the typical monthly water and wastewater bills for single family residential (SFR) customers across 28 agencies to compare to the San Francisco Public Utilities Commission (SFPUC) current and proposed rates.

A comparison survey is an important tool to gauge how rates align with those of other agencies and also allow for opportunities to explore best management practices. The SFPUC is a system with a distinctive retail customer base and substantial capital improvement program. Care should be taken in drawing conclusions from comparisons as factors including locations, source of supply, customer profiles, age of the system, and various operational and capital-related needs vary by agency.

San Francisco Public Utilities Commission

The SFPUC Water Enterprise has two monthly charges: 1) a fixed service charge based on meter size and 2) a variable volumetric charge based on usage by customer class. The existing monthly service charge is a combined meter charge and customer service charge. For customers with a 5/8-inch meter, the monthly service charge is \$11.63. For residential customers, the variable volumetric charge is assessed by tier. Tier 1 single family residential (SFR) customers are charged \$6.42 for the first 4 hundred cubic feet (ccf)¹ of water consumed and \$8.62 for each additional ccf. Existing residential rates for the Wastewater Enterprise are based on flow and assumed typical discharge characteristics. The SFPUC does not have an existing wastewater fixed monthly charge. Residential customers are charged \$12.40 per ccf of wastewater flow.

For water, Carollo recommends maintaining the same tiered residential rate structure with increases to both fixed and variable rates. In FY 2019, residential customers with a 5/8-inch meter will incur a monthly service charge of \$12.19; the variable volumetric charge will be \$7.06 for Tier 1 usage and \$9.05 for Tier 2 usage. For wastewater, Carollo recommends introducing a flat, fixed monthly service charge of \$0.99 that does not vary by meter size or customer class. Residential customers will be charged \$13.28 per ccf.

RATE SURVEY APPROACH

Water and wastewater utility agencies in 28 cities were selected for the survey including ten California Bay Area cities, eight greater California cities, and ten cities in the US outside of California. The survey presents data on water rates and wastewater rates. The following sections describe the survey content and methodology.

Agencies

The survey summarizes fixed service charges and volumetric consumption charges for water and wastewater from agencies within the California Bay Area, the State of California, and nationally. The ten California Bay Area cities include San Francisco, Antioch, Concord, Fremont, Hayward, Novato, Oakland, Palo Alto, San Jose, and Union City. The eight greater California cities—in addition to San Francisco—include data from Bakersfield, Fresno, Los Angeles, Riverside, Sacramento, San Diego, Santa Cruz, and Stockton. For the ten national cities, the survey includes Cincinnati, Houston, Las Vegas, New York City, Philadelphia, Phoenix, Portland, San Antonio, Washington DC, and Seattle.

¹ ccf is one hundred cubic feet, 1 ccf = 748 gallons

Assumptions

The following are assumptions used during the survey:

- All billing rates frequency is reported as monthly charges, regardless of the billing schedule, to provide a uniform cost comparison.
- Ccf is used as the common volume measurement. Conversions were made where necessary.
- Each agencies <u>typical</u> monthly usage (in ccf) was used. This varies by agency and is indicated on the figures in the following sections.
- If a typical SFR monthly wastewater flow was not provided, a 90 percent return to sewer factor was applied to the typical SFR monthly consumption to determine the typical wastewater discharge volume unless otherwise indicated.
- The survey reports residential billing rates for SFR households with a 5/8- or a 3/4-inch meter, depending
 on what is typical for each agency.
- Rates are primarily comprised of two components: (1) a base/fixed monthly service charge plus (2) the
 commodity rates. Conservation incentives, low-income rate assistance and other opportunities for bill
 adjustments were excluded from this survey.
- Private fire service charges and some miscellaneous charges were excluded, as well as elevation surcharges since they were often \$0.00 for the initial elevation level or zone.
- If rates varied by season or household details other than water consumption, as assumption was made and noted during the monthly bill calculation.

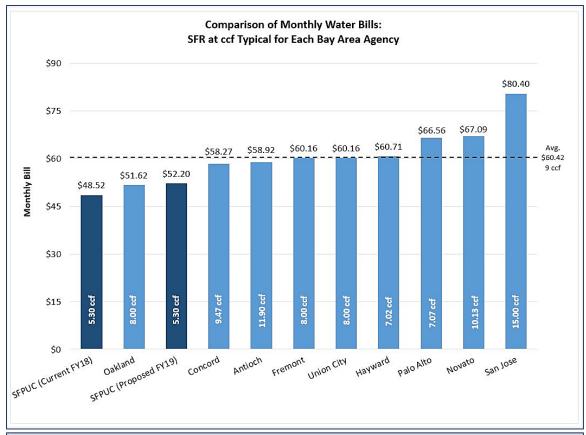

Methodology and Limitations

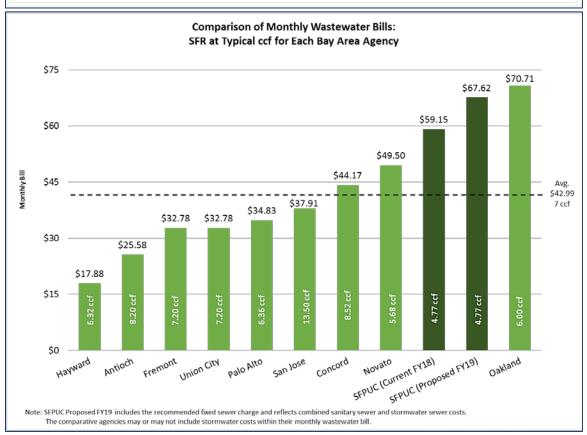

Compiling data began with the website of each city, district, or agency to obtain basic information on the service area, the water services provided, and the rates. The majority of the information gathered for this survey is based on the information accessible on these websites including Master Fee Schedules, Operations Reports, Comprehensive Annual Financial Reports (CAFRs), and monthly bill calculators where provided. Urban water supplier data that is available on the California Water Resources Control Board website was used to average water use when the information was not specifically provided on each city, district, or agency website (Stockton City, City of Sacramento, and Concord).

It is important to note that the charges included in the rates tables are not exhaustive in that not all agencies listed fees which make up comparable bills beyond their fixed service charge and volumetric rates. For example, stormwater charges are reflected in a multitude of ways from property tax bills, to assessments to wastewater bills and explicit stormwater charge dollar values were challenging to identify for most agencies. Due to this, stormwater charges were not isolated from wastewater charges in the rates table. However, as the SFPUC operates a combined system and stormwater charges are included in the overall wastewater bill, the SFPUC wastewater bill (and subsequent combined bill) may be skewed to the right in the comparison against other agencies.

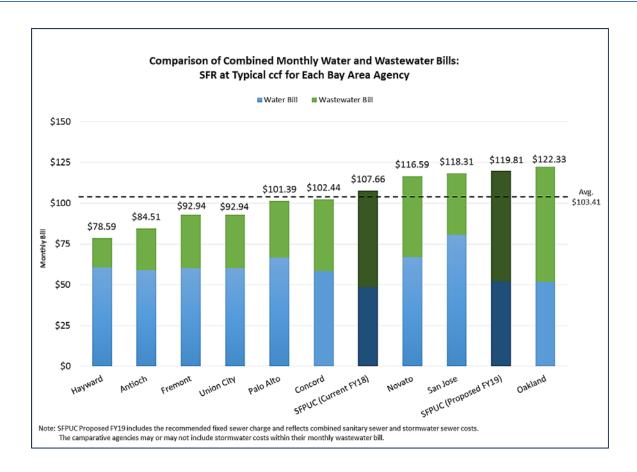

Most of the data collected involved rates with an approved effective date of the fiscal year ending (FYE) 2018 (typically begins July 1, 2017) or January 2018. Notes were made where rates had not been updated within this range. The following figures are the results of the survey.

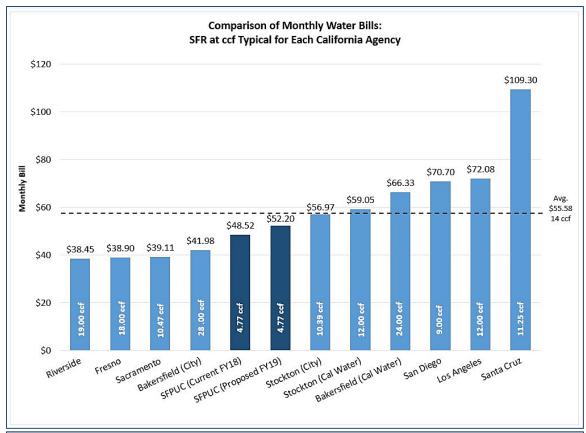

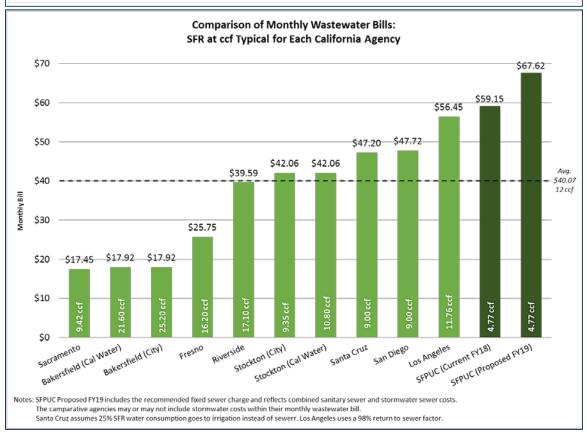

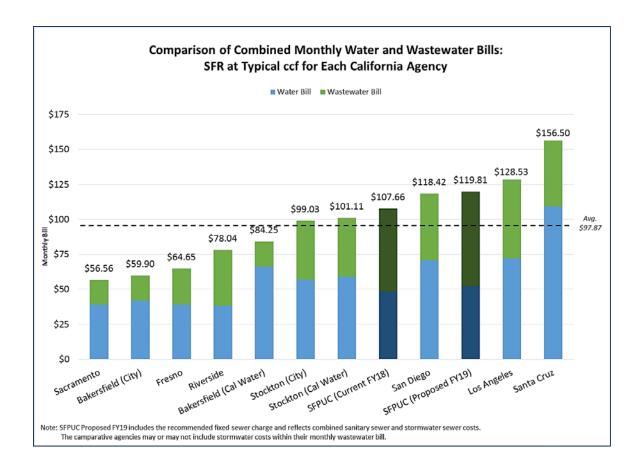

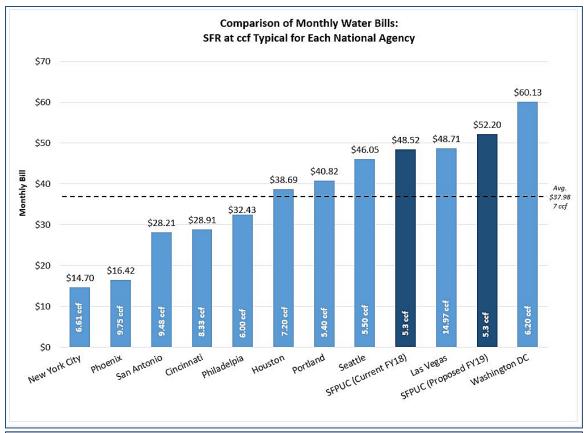

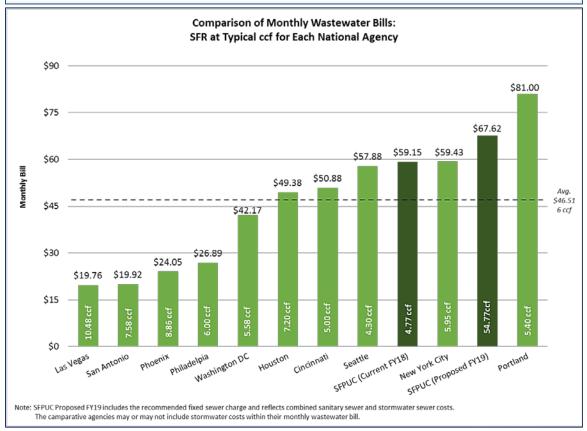

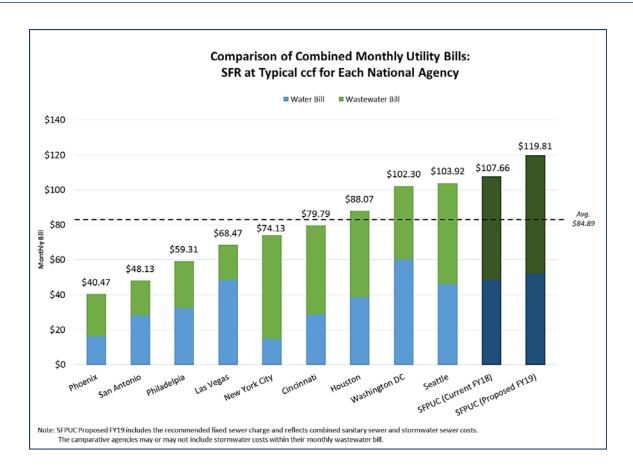

UTILITY AGENCY RATES

The following tables summarize the SFR customer class water and wastewater rates for each of the 28 utility agencies.

| | | Fixed Cha | rge | | Variable Charges | |
|---|-------|----------------------------|------------------------------|-------------------------------------|--|---|
| Utility Agency | State | Fixed Water Charge Type | Monthly Fixed Charge (\$) | Residential Water Rate Structure | Tier Breaks | SFR Water Rate (\$) |
